Single Copies, Ten Cents.

Electric Tower at Buffalo, N. Y.

Those who saw the electric tower at the Chicago Exposition in 1893, or the one at the San Francisco Midwinter Fair in 1894, were greatly pleased with the charming effect either one produced. At the Pan-American Exposition, to be held in Buffalo, N. Y., this year, it is intended to have an electric tower that will fittingly typify the beauty thus made possible and the advance in electrical science. A view of the tower appears herewith. It is intended to be the central and crowning figure of the electrical display. The height of the tower is 375 feet above the surface of the broad basin in which it stands, looking down upon the Electricity Building on the west. It will be noted that the tower is flanked on the east and west by long curved colonnades, which sweep to the southward and terminate in airy pavilions, forming a semi-circular space 200 feet across. Within this space, and in a high niche in the main body of the tower, are cascades; about the basin are leaping jets and countless figures, each with its spurt of water. At the center of the niche is a tall geyser fountain, whose waters find their way from the high basin within the niche over successive ledges and among a multitude of vases to the level of the pool.

The main body of the tower is 80 feet square. From the surface of the water to the top of the colonnades is 75 feet. The shaft of the tower is treated with great simplicity. The center of each side is paneled with fantastically perforated work, through which is indistinctly revealed the massive framework of the tower. This feature is calculated to produce a remarkable effect when lighted from within, as it is the intention to do. The main shaft of the tower terminates in an elaborate entablature at the height of 200 feet. The crown of the tower rests upon this entablature, and is composed of three stories of diminishing proportions and varying design. The lower of these stories is an arcaded loggia, rich in

ornamentation and having the wall surfaces brilliantly colored. Paviliones at the corners terminate in light fantastic cupolas. The second stage, or lantern of the tower crown, is in the form of a high, circular colonnade, entirely open, so as to allow the effect of the sky to be seen between the columns. A spiral

rates that country from the United States.

Sculpture plays an important part in the decoration of the tower. Two monumental groups of statuary flank each of the four sides of the base. Above the water niche in the southern face of the tower is an escutcheon, representing the arms and seal of the United States. In the spandrel of the arch above the niche are sculptures in relief.

The pavilions and wings are also decorated with sculpture and architectural devices. The entire exterior of the tower will be studded with myriads of electric lights, so arranged that a great variety of effects can be secured. The use of electric lights in combination with the sparkling fountains and cascades will produce a fine effect.

The electricians at the Pan-American Exposition have the responsibility of intending to present to the world the most elaborate electrical effects ever fashioned by the human hand, and are dealing in large figures. Contracts have been made for the delivery of 5000 H. P. from the electric power plants at Niagara Falls. This will require the special construction of a transmission line connecting the Exposition with the main transmission line of the power company. The 10,000 volts will be transmitted by bare copper cables of nineteen wires each, strung upon insulators, 10 inches in diameter, placed upon high poles. The reception of this volume will give an opportunity for the exhibition of various step-down transformers which will reduce the voltage to various units that will permit its use

ELECTRIC TOWER.

staircase within the colonnade leads to the last stage of the tower—the cupola, over whose soaring dome is poised the figure of the Goddess of Light, in hammered brass, thus dominating the entire Exposition, which owes so much to her generously exerted power.

The entrance to the tower is across an ornamented bridge from the plaza, on the north side. Elevators will carry passengers to the various floors. From the cupola the eye can sweep the Niagara frontier, and look into Canada, beyond the river that sepa-

for power and light. Besides the 5000 H. P. received from Niagara Falls, about 4000 H. P. will be generated upon the Exposition grounds by means of gas engines of various sizes up to 500 H. P.

In the illumination of the Exposition courts and grounds more than 200,000 incandescent electric lights will be used, the wiring for which will require 250 tons of insulated copper wire. It will take about 400 miles of wire properly to carry out the lighting features, as planned by those in charge.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Electric Tower at Buffalo, N. Y., 1. Mining and Metallurgical Patents, 7.

EDITORIAL.—Electric Tower at Buffalo, N. Y., 1. Advance in Prices; Municipality Furnished with Cheap Power; Progress in Smelting; Standard for Electrical Measurement; Industrial Development of California Founded on the Mining Industry; A Necessary Measure; One of the Industrial Developments of This Century; Reported Sale of the Mulatos Mine, Mexico; Effort to Secure Restraining Barriers on the Yuba River, Cal.; The Miner's Inch From a Canadian Standpoint; Modern Mining Methods; A Common Mistake; Changes in Surface Formations and Conditions; A Singular Plea; The Imprudence of Mine Managers, 2.

MINING SUMMARY.—8-9-10-11.

LATEST MARKET REPORTS.—11.

MISCELLANEOUS.—Concentrates, 3. Power Transmission, 4. Treating Non-Smelting Ores in South America; Coarse Concentrating Without Sizing; Colorado Mine Report for 1900; Magnetic Separators; Patent for Co-owners, 5. "The Miner's Inch" in Canada; Leaching Copper Ores; Always Advisable; The Cost of Mining, 6. Mining and Metallurgical Patents; Rhodium Alloys, 7. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Personal; Recently Declared Mining Dividends; Catalogues Received; Commercial Paragraphs, 11.

"PRICES will not be advanced when the consolidation is completed." The consolidation of mining interests is about the only thing of the kind of which the quoted remark can with truth be said.

DETROIT, MICH., furnishes an example of a municipality furnished with cheap power, gas-engine power in that city costing \$12 per horse power per year—manufactured gas being sold for 50 cents per M feet for use in gas engines. A good modern gas engine will deliver one full brake horse power with 10 cubic feet of natural gas per hour, which, at 20 cents per 1000 feet, equals one-fifth of a cent per horse power hour for gas.

THE progress made in smelting is aptly illustrated in the case of the I. X. L. mine at Rossland, B. C., which, though it has a 10-stamp mill within 1000 feet of its ore bins, ships its output to a smelter, because the loss in milling foots up more than the freight and treatment charges of the smelter, the latter paying 95% of the gold and silver value of the ore. The fact that the I. X. L. produces what may be styled "free-milling ore" emphasizes the instance.

CONSIDERABLE has been said herein as to the necessity of some recognized standard for electrical measurement. There is a similar existing need regarding a working standard for electrical light. There is not now in existence any workable primary standard that can be used by the ordinary photometer corps, and it is manifestly to the interests of electrical engineers everywhere that some action be taken looking to a correction of this condition.

AS ELSEWHERE, the industrial development of California is almost wholly founded on the mining industry. Had it not been for mining, the Union Iron Works would not have been in condition to make such a battleship as the Oregon and the other vessels that have won for the American flag imperishable renown. Mining brought giant powder into being; it created the Pelton wheel and others of its kind; it brought into being the iron and steel pipe as now made. The cable railway, a San Francisco invention, was inspired by similar use of a wire rope in the Dardanelles drift mine in Placer Co., Cal. Mining has called into existence the largest electrical transmission systems, and is the mother of many other discoveries and inventions of material general value.

A Necessary Measure.

Several mining State Legislatures meet this month and will essay some mining legislation. There are many needful laws which in enactment and observance could be of great value to mining men everywhere. It has been suggested that one salutary requirement would be to the effect that surveys of all underground workings be made and filed with properly designated authority. Mines change owners, properties are abandoned and reopened, and oftentimes it is under present conditions impossible to get any records, the new owners or developers being obliged to depend on whatever meager information may be secured from former superintendents or workmen. Cases will suggest themselves to many readers where thousands of dollars could have been made or saved had there been some accessible record of former exploration or development work. It would be of great value to the several mining States to have substantially such statute enacted, and greatly aid in developing the different districts, it being of common knowledge that whatever occurs in one mine in any district is liable to occur in others therein.

ONE of the industrial developments of this century will be electrical transmission even beyond the present advanced point it has attained on the Pacific coast. While feats of engineering can be exhibited that would not warrant commercial furtherance, it is manifest from actual continued work that electricity in mining and industrial development will have commanding place. Even at Buffalo, where good coal can be had for less than \$2 per ton, electricity is in successful competition with other forms of applied energy, though with steam coal at that figure one electrical H. P. must be delivered at a motor in Buffalo at a cost of 1 cent to admit of such successful competition. It is not for the pageantry or pomp of such a show as that typified by the tower illustrated on the first page of this issue that it is deserving of notice herein, but as grandly exemplifying the possibilities of the energy that actuates it on the threshold of the new century. On this coast, where fuel under the most favorable considerations costs twice as much as at Buffalo, the question assumes a more important phase. Fortunately water and gravity aid in the solution of the problem. The streams flowing from the mountains on their way to the sea furnish enough energy to supply electrical light and power to ten times the present population that look out from the western front door of the nation.

THE Mulatos mine, Sonora, Mexico, is reported sold again, this time to men who "will build the largest mill in the republic of Mexico." The voluminous information is vouchsafed that "the ledge is 800 feet wide, and that it would take a 500-stamp mill centuries to reduce it." It is now about ten years since Hayward & Hobart of San Francisco brought suit to recover \$1,575,000, which they had paid for the Mulatos mine, alleging that it had been "salted." The Mulatos has been a frequent subject for examination by California mining engineers—Ferguson, McGaskill, Bowie, Janin, Gillette, Harvey and others. Alvinza Hayward tried to work it systematically, on a large scale; but, after an aggregate loss of about \$300,000 on the whole transaction, he got out. It is another case of a big mine with a big name. A great mining property that has been a great producer takes on some of the attributes of immortality. Fifty years from now men will tell of the big Cripple Creek dividends, and will get others to take hold of the properties, now profitable producers, in an attempt to resuscitate the glories of the past.

TO THOSE who through the years have noted the effort to secure active work on the restraining barriers in the Yuba river, Cal., the dilatory tactics of some of those who have power must be a source of regret. Still, despite the official drag, the effort does go on. As it stands now, there is \$500,000 available; the work is expected to cost \$800,000. The California delegation will try to get an additional Congressional appropriation of \$150,000, and it is probable a similar amount can be secured by State appropriation this winter, which would make up the necessary amount. This paper never indulges in reproach nor recrimination, and rarely ascribes unworthy motives

to action or inaction, but it is moved to remark that two needed public measures dear to the heart of every California miner, the mineral land bill and the impounding barriers, move with a suspicious slowness that lends color to the assertion that some mysterious influence is continuously successful in retarding the progress of those two necessary measures.

ELSEWHERE appears an elaborate discussion of the "miners' inch" from a Canadian standpoint. Some of the suggestions are hypercritical, and savor more of the laboratory or college cloister than of the practical, every-day requirements. Probably the easier or better way to arrange this matter would be to have defined by State statute just what a "miners' inch" is, a legal standard of value. This paper suggests that the statute specify a flow of 1½ cubic feet per second. That would be probably satisfactory, could not be misunderstood, and in that case 40 miners' inches would equal a flow of 1 cubic foot per second, the term in which hydraulic engineers usually make their calculations. What shape or size the box should be, or under what conditions the water should flow, had best be left out of any law on the subject. Local conditions could best determine how the water should be measured. The one thing needful would seem to be a quantitative standard only.

A good illustration of modern mining methods on the threshold of the twentieth century is afforded in Calumet, Mich., where a shaft nearly 1 mile in depth is now being sunk, and, by means of a telephone 5000 feet below the surface of the earth, on the fifty-third level of No. 5 shaft, Calumet branch of the Calumet & Hecla mine, one can stand at the bottom of the shaft and talk to Chicago, Minneapolis, Detroit or Cincinnati, the mine telephones being connected with the long-distance service, as no grounded telephones are used in the mine and telephonic connection can be had with any of the cities of the country that are reached by the overground long-distance service.

IT is a common mistake to assume that economy requires or justifies the payment of inadequate wages or salaries. It is true economy to see that competent men are employed in every department of mining and metallurgical work, and that they be paid accordingly. It has long been quoted that "the laborer is worthy of his hire." He certainly is, in more ways than one: he very soon becomes "worthy" of it, and of no more. For the man who finds that his employer values his services at less than they are really worth, or can be made worth, is likely, if he cannot get such valuation, to agree therewith, and give him only the service in amount and quality for which he is paid.

THOUGH Nature takes no note of time, and its processes are immeasurably slow, yet even in our brief lives can be noted changes in surface formation and conditions. Recent events show how such transformation of appearance slowly takes place. Hudson bay is gradually becoming dry land, as is Tulare lake, the largest lake in California; an earthquake on the Alaskan coast has destroyed the great Muir glacier and completely changed the aspect of that coast, and Steamboat springs, Nevada, have gone dry. At the last mentioned place the process of deposition of metals had long been a noted phenomenon, repeatedly illustrated and described in this and other journals.

ON the principle that a good many things in this world are not had because not asked, a Chicago manufacturing firm that needs more room has asked that city to vacate that portion of the street along which the factory is built, that an extension or enlargement of the enterprising firm's business may be built thereon. The firm argues that they will employ more men and that the enlarged factory will be worth more to the municipality than the now disused street. 'Tis a singular plea, and, if granted, will constitute a troublesome precedent.

IN the issue of this paper of Oct. 3, 1896, T. A. Rickard, late consulting engineer of Stratton's Independence, Ltd., speaks of "the imprudence of mine managers who are forgetful of the necessity of doing an amount of exploratory work which shall keep pace with the removal of ore."

Concentrates.

PURE silicon-copper is made in an electric furnace at Lockport, N. Y.

MONTANA'S copper output for 1900 is estimated to be 300,000,000 pounds.

THE use of a steel or iron tamping bar in loading holes is unlawful in Colorado.

A good hard solder for brass is made thus: Copper, 50 parts; zinc, 46 parts; silver, 4 parts.

IN 191 feet of 3-inch pipe there are 150 square feet of surface: $3 \times 3.1416 \times 12 \div 144 = .785$; $191 \times .785 = 150$.

ABOUT 10,000 pounds of molybdenum were produced in the United States in 1898, worth about \$1.25 per pound.

GALVANIZED WIRE ROPES are unfit for use in mine hoisting, as the zinc coating soon wears off and corrosion of the iron causes danger.

THERE is no invention to put off missed shots with safety. Several lives are annually sacrificed and many more endangered in such efforts.

A HOLE bored lengthwise through timber facilitates weather seasoning of green lumber, and northwestern lumbermen who have tried it say that it adds strength to the stick.

THE workings of the Kennedy mine, Amador county, Cal., are probably the deepest of any purely gold mine in the world. It is the ultimate intent to have the shaft 3500 feet deep.

THEORETICALLY, there is no limit to the horse power of a gas engine, it being a question of cylinders. In Belgium gas engines of 1000 H. P. are now in successful operation.

LIQUID CARBON DIOXIDE—liquefied carbonic acid gas—will instantly and effectually smother a fire, and is of use on shipboard or in mines, a cylinder of it often preventing disaster.

ONE pleasant feature of gold dredging is that where good ground is secured, and a proper machine intelligently operated, the money required to run it is furnished by the dredger itself.

WITH a heater of proper size water may be heated to 208° F. in a closed heater by exhaust steam. About one-half square foot of pipe surface should be allowed for each H. P. developed in the engine.

THE highest price of lead in cents per pound in New York City in the past twenty-five years was in March, 1877, 6½ cents per pound. Its lowest price in that period was in August, 1896, 2.9 cents per pound.

ALL files, when they leave the factory, are covered with oil to prevent rust. When the file is to be used for such work as finishing large cast-iron surfaces of a glassy nature, the oil should be thoroughly removed.

THERE is no correct or complete list or directory of mines or mine superintendents in or for any State or Territory. The user of any such purported "list" will find about one-half of his letters "returned to writer."

A COMPACT LAYER of soot from soft coal one-eighth inch thick in a boiler tube will occasion as much waste of fuel as the same thickness of scale. With soft coal, to have clean tubes they must be daily blown or scraped.

AN injector will raise and force water by means of a jet of steam. It is not so large as a pump of equal capacity, takes up less space, has no moving parts, heats the feed water and, rightly run, costs less than a pump of the same capacity.

PALLADIUM is generally found associated with platinum, from which it is separated by chemical process. It is harder than platinum, fuses at a higher temperature, is worth nearly double, but has a specific gravity about half that of platinum.

THE advantages of using zinc dust instead of zinc shavings in the cyanide process are claimed to be: saving in first cost of construction of plant; ease in handling precipitated gold; intimate contact of precipitating medium with solution; longer time of contact, if necessary.

TO FIND the number of gallons of water that a pump of given size is capable of raising in a given time, multiply the square of the diameter of the water cylinder in inches by four and by the piston speed in feet per minute; divide the result by 120; the quotient will be the number of gallons per minute.

THE value of the record furnished by the diamond drill varies inversely as the value per ton of the material sought, as more dependence can be placed upon the record furnished by the diamond drill when searching for uniformly distributed ores than when searching for high-grade, irregularly distributed ores.

IN determining carbonic acid in limestone, one grain of the finely ground sample is placed in the bottom of the crucible and on top of this is placed a layer of ignited asbestos. The ignition is maintained for half an hour. In determining water alone, there is, after the crucible, only the weighed calcium chloride tube and the guard tube of calcium chloride.

TUNNEL SITES may be located on patented land, if belonging to tunnel site locators, or if not on land by consent of the owner thereof, either patented or unpatented. But such tunnel can not be driven through any lode claim previously located without the consent of the owner thereof. All agreements of such kind must be

in writing, properly acknowledged and recorded in the county records of the county wherein the tunnel site is located.

A "BARREL" is an indefinite term. The "barrel" of the schools is 31½ gallons. The "barrel" of statistics is 42 standard gallons of 231 cubic inches each. A barrel of petroleum varies from 40 to 50 gallons. The Canadian barrel is 35 imperial gallons of 277.27 cubic inches each, hence contains 9704.4 cubic inches. The American standard barrel is 9702 cubic inches.

A TON of coal as carbonized in a gas works yields from 10,000 to 11,000 cubic feet of gas, which hold in diffusion 20 pounds to 24 pounds of hydrocarbon vapors, including 16 pounds to 18 pounds of benzol, about 120 pounds of liquid tar, of which 25 pounds to 30 pounds are carbon held in suspension, 2 pounds or 3 pounds are hydrocarbon similar to the vapors above mentioned, and 12 pounds to 14 pounds are naphthalene.

CHEMISTRY, like electricity, now enters largely into nearly all manufacturing processes, and the saving of by-products is usually a question of chemical engineering only. It is one thing to perform a chemical experiment in a laboratory, in a small way, where the economy of the operation does not enter at all, and an altogether different thing to devise ways and means by which the same thing can be done continuously, on a large scale, in a factory, and at such a cost as to make the operation profitable. The man who can do both of these things is the chemical engineer.

DIFFERENT mine managers and superintendents have different ways of figuring costs, and may show a large production of ore at very small cost, though the figures for exploratory work and construction may be very large. Another may show very small cost of milling, indicating ability to make extremely low grade ore pay. As for the cost of mining and milling per ton, that can be ordinarily determined by dividing the total tonnage mined and milled into the total costs; the yield per ton is the tonnage milled divided into the gross bullion product; the profit per ton is the difference between the cost and yield per ton.

WIRE NAILS will stand the weather test better than steel cut nails. The surface of wire nails is entirely smooth; that of the cut nail is rough on two sides, giving greater opportunity for collection and saturation of moisture. As between steel and iron there would be an advantage in using steel nails, as they are less liable to rust. The process of galvanizing nails after cut has been perfected, the use of the galvanized nail being advocated. It is desirable to use a small nail with extra large head, and nails galvanized after they are cut, not nails cut from galvanized wire, as on the latter the head and point are exposed and the coating is not as perfect as in the case of nails galvanized after cut.

To determine the gold in copper bullion a usual scorification method is as follows: Weigh out ten samples of 0.1 assay ton each, scorify with fifty grains of test lead, and pour. Remove the slag adhering to the lead buttons and repeat the scorification twice, finally uniting five buttons into one, thus obtaining two lead buttons weighing about twelve grains each, and corresponding to 0.5 A. T. of the original bullion. These are to be cupelled as usual, and should check each other within the allowed approximate limits. This method involves some labor and expense, but is deemed to give results to 0.08 ounce gold higher than the ordinary method on bullion running from \$40 to \$60 per ton.

ELECTRIC detonators or exploders for blasting are made and sold. With a little effort one can make one for himself. Take two pieces coarse copper wire, about No. 14 or 16; join the ends with a piece of fine platinum wire, No. 26 or 28. The platinum and copper wires should be joined by twisting rather than by soldering. About ¼-inch of free platinum wire is needed between the copper wires. The other ends of the copper wires are to be joined to the battery. The platinum wire is to be buried in the black powder to be ignited. When the circuit is closed, the electric current heats the platinum wire to redness, and this fires the powder. A two-cell dry battery is ordinarily sufficient. Size for size the resistance of platinum is about 5½ times that of copper.

WHERE the locator of a claim allows his title to lapse by reason of non-performance of assessment work and the claim is taken up by another, all improvements made thereon and upon the claim at the time the second locator has perfected his location becomes the property of the second locator—any State laws to the contrary notwithstanding. The original locator has the right to remove any and all improvements while the claim is still in his possession—loses this right when his successor has taken up the forfeited location and perfected his location of the claim. Fixtures, including such improvements as engines, boilers, hoists, mill, or any other things of this character annexed to the soil for mining, become part of the freehold, and as such pass to the relocater.

AS the heat conducting power of copper is about twice that of iron or steel, one would naturally suppose that a much smaller boiler would do for the same power if made of copper than if made of iron or steel; but such is not the case. Nor does it make any material difference after a boiler has been in use a few times whether it have tubes an inch thick or 1-100 of an inch thick in so far as evaporation is concerned. The reason for this lies in the fact that the main resistances to the passage of the heat from the fire to the water are not the resistances offered by the metal itself, but are due to a film of air or burnt gas

which clings to the metal on the furnace side, or, more probably, to the soot or metal oxide on the furnace side, and also to a similar (but less) resistance which the heat encounters in forming on the water side. Consequently, when all three resistances are added together the resistance of even the thickest plates of steel in use for boilers is so small that it amounts generally to less than 1% of the resistance offered by the air and vapor films.

ZINC SLABS suspended in steam boilers prevent the formation of scale. The proportions are 1 square foot of zinc to 50 square feet of heating surface in new boilers, which may be diminished after a time to 1 in 75. The best method of fixing the zinc is to place a number of studs in the sides of the furnaces and combustion chambers and to bolt on to these studs the zinc plates, which should be about 10x6x1 inch. It is important to see that the contact surfaces are clean and bright and the nut screwed close to the zinc to exclude the water from the contact surfaces, and thus comparatively insulating them and preventing galvanic action. Otherwise the zinc is acted upon mostly as a solvent that renders the water innocuous or non-exciting.

THE mass—that is, the weight—of a line of given length and resistance is proportional to the product of the resistivity (that is, the specific resistance), and the density of the material, both of which are physical constants. This product for iron is 78, for copper 14.24, and for pure aluminum 7.54. The weight of metals for lines made of these materials will therefore be the proportion of these figures. If, for instance, the cost per pound of aluminum is about double that of copper, then the cost of the line would be about equal for these two materials, as 14.24 is about double 7.54. When the cost of aluminum is less than that, it would be the cheaper of the two metals. Copper is quoted this week in New York City at 17 cents per pound, and aluminum at 35 cents per pound. It is to be borne in mind that the line, if of aluminum, would have to be larger than if of copper.

TO REDUCE silver sulphate to metallic silver, it may first be leached from other substances present by means of hot water. The silver sulphate solution is then run through a series of vats containing vertical plates of copper, when in the chemical reaction each ounce of silver will be replaced by 0.16 ounce of copper, resulting in the consumption of copper and the precipitation of the silver in the form of fine mud, subsequently collected at the bottom of the vats, washed and refined. It can be refined in any one of three ways—by melting in graphite crucibles with a small amount of niter and carbonate of soda; by melting with lead and cupelling; or, by being cast into convenient-sized anodes and treated electrolytically. The copper consumed in the precipitation spoken of above may be recovered by passing the copper sulphate solution over scrap iron, forming cement copper and ferrous sulphate.

THE question of the strength of materials for boilers was elaborately tested some years ago by the Franklin Institute. It was then found that the tenacity of boiler plate increased with the temperature up to 550° F., at about which point the tenacity began to diminish as the temperature rose. At 32° F. the cohesive force of a square inch section was 56,000 pounds; at 570° it was 66,500 pounds; at 720° it was 55,000 pounds; at 1050°, 32,000 pounds; at 1240°, 22,000, and at 1317°, 9000 pounds. Copper follows a different law and appears to be diminished in strength for any increase in temperature. At 32° F. the cohesion of copper was found to be 32,800 pounds per square inch section, and exceeds this cohesive force at any higher temperature, the indications being that the square of the diminishing strength keeps pace with the cube of the increased temperature. Strips of iron cut in the direction of fiber were found to be 6% stronger than when cut across the grain. Welding was found to increase the tenacity of the iron, but welding together different kinds of iron was not found to be favorable. Overheating was found to reduce the ultimate strength of plates from 65,000 to 45,000 pounds per given section, and riveting of plates was found to diminish the strength one-third.

IF a gas engine has been tested with gas of low quality, and is put into hard service with a fuel of higher calorific value, the greater heat given to the piston will cause it to bear too tightly at some points upon the cylinder walls. This is because the mass of iron in the piston is not homogeneous, and the denser portions will be subject to greater expansion. After running for a short time under full load, when these conditions exist, a sharp knock will be heard in the cylinder at every revolution, and, if the piston is removed, it will be found that some parts of the surface are worn bright while the rest shows no wear. The only remedy is to file down the bright spots until where fully loaded the wear will be uniform. The maker of the gas engine will see when the machine leaves his place that the piston runs smoothly with the gas used in testing, but greater heat will occasionally cause one to run with too much friction, and require some additional fitting. If, by any chance, the engine is found to be very hot, cold water should never, under any circumstances, be turned suddenly into the water-jacket and the engine kept running. The almost certain result of such an act will be the instant contraction of the cylinder walls upon the expanded piston, with an enormous increase in friction, possibly enough to lock the piston and wreck the engine. In such a case the safe plan will be to stop the engine first and cool it afterward, but, when this is not practicable, turn on the cold water very slowly, so that the piston may cool to some extent along with the cylinder.

Power Transmission.

By ALTON D. ADAMS.

The disadvantages of steam driven electrical machinery for long-distance transmission power arise from the fact that but a small fraction—hardly more than 7% or 8%—of the energy of coal can be delivered at the receiving station, while the investment must include equipment having capacities several times greater than the rate of power delivery. On the varying loads of a large power transmission system it is probably fair to assume a consumption of 2 pounds of coal per horse power hour developed in engine cylinders. The following efficiencies may also be fairly assumed for the several elements of the generating and transmission system: Steam engine, 90%; dynamos, 90%; step-up transformers, 95%; line conductors, 80%; step-down transformers, 95%; rotary converters, 90%. The combined efficiency of all these parts is obviously the product of their individual efficiencies, or $.90 \times .90 \times .95 \times .80 \times .95 \times .90 = .52$, or 52%, referred to the power developed in the engine cylinders. As each horse power hour developed in the engine cylinders requires 2 pounds of coal, and the machinery and line waste about one-half of the energy imparted to them, about 4 pounds of coal must be consumed for each horse power hour delivered at the point of use. A coal, moderately good, will yield, on burning, 12,000 British thermal units per pound, so that 4 pounds develop 48,000 heat units.

Since one horse power hour is the equivalent of 2545 heat units, the steam and electric transmission system, on the above basis, delivers from the receiving station about $2545 \div 48,000 = .053$, or 5.3% of the energy derived from the coal burned at the generating plant. Counting the delivery capacity of the steam engines at the generating stations as 1, the capacity of the electric generators is .9; step-up transformers, $.9 \times .95 = .855$; step-down transformers, $.9 \times .95 \times .80 \times .95 = .65$; and that of the rotary converters, $.65 \times .90 = .58$ of the engine outputs. The total combined capacity of engines and electrical apparatus necessary is, therefore, about $1 + .9 + .85 + .65 + .58 = 3.98$ times the engine capacity. For each electrical horse power delivered by the rotary converters there must, then, be installed a capacity of $3.98 \div .38$, or nearly 7 H. P. at the generating and receiving stations.

The development of gas engines is of marked interest in connection with the problem of long-distance power transmission, because the energy developed as mechanical motion in their cylinders bears larger ratio to the total energy from coal consumed than is the case in steam engine cylinders. It was assumed for the above case that the development of one horse power hour in the steam engine cylinder requires the consumption of 2 pounds of coal containing about 24,000 heat units, and though slightly better results can be obtained under the most favorable conditions, they are hardly expected to be in a plant for power transmission. In contrast to the above results with steam engines, gas engines are now at work that deliver a horse power hour on a consumption of gas containing less than 12,000 heat units.

The weight of coal necessary to generate a quantity of gas that will develop 12,000 heat units when burned varies with the process of gas production. Coal gas is made by distilling bituminous coal, and 1 ton of coal yields on the average about 10,000 cubic feet of gas, 1400 pounds of coke, 10 pounds of tar and 20 pounds of ammonia sulphate. About 350 pounds of coke are required to reduce 1 ton of coal to the above products, and this leaves the net amount of coke at about 1150 pounds per ton of coal treated. Coal gas yields, approximately, 650 heat units per cubic foot when burned, so that the gas from 1 ton of coal represents $650 \times 10,000 = 6,500,000$ units, more or less, that is, slightly more than one-fourth of the total heat per ton of coal, allowing $12,000 \times 2000 = 24,000,000$ heat units to the ton. On the basis of 10,000 cubic feet of gas per ton of coal, each pound of coal produces $10,000 \div 2000 = 5$ cubic feet of gas. From 16 to 17 cubic feet of this gas are required per horse power hour in engines of fairly large capacity, and this amount of gas obviously requires from 3 to 3½ pounds of coal for its production. The value of coke and other products above named, aside from the gas, is usually greater than that of the coal from which they are obtained, so that the cost of the gas consumed per horse power hour in gas engines is much less than that of the total coal consumed—to a company that produces the gas. The production of coke by a process in which all the gas, tar and ammonia are wasted, and only about 1400 pounds of coke obtained per ton of coal, is a large and paying industry. Coke from gas ovens or retorts is usually 10% to 20% less in value than coke from the purely coke ovens, but it appears that the tar and ammonia have enough value to make up this difference, so that gas and coke ovens can be operated close to the mines at a profit, even if the gas is wasted.

Coal gas, representing only about one-fourth of the heating energy of coal from which it is produced, is not, however, the only kind of gas to be considered for power transmission. Anthracite coal and coke, when properly treated, yield fuel and produce gas that contains as much as 80% of the units in the coal,

and rice coal, or that of the least value, because of its fine size, is really used in this process.

One ton of anthracite coal, rice size, will generate fuel gas having fully 20,000,000 heat units, or about 140,000 cubic feet, each foot containing not less than 140 heat units. Each pound of coal, therefore, produces as much as 70 cubic feet of this fuel gas, and, as not more than 85 cubic feet of the gas are required per indicated horse power hour, the coal consumed per horse power hour is from 1 to 1½ pounds, or but little more than one-half the necessary amount for steam engines. In the plant with gas engine a choice can be had between regular coal gas and producer of fuel gas. If coal gas is used, about 3.5 pounds of coal must be handled per horse power hour at the engines, but the coke and other products are worth more than the entire amount of coal used. When fuel gas is used in the engines, less than 1.25 pounds of coal are used per horse power hour, but there are no valuable side products. The gas engine thus greatly increases the chance of financial success of electrical transmission of energy from cheap fuel to great distances by cutting the fuel item in two.

The necessary low efficiency, the great combined capacity of its elements, and the large capital outlay for the electrical equipment still leave its ability to compete with railway transportation of coal in doubt. The gas engine develops one horse power hour, the equivalent of 2545 heat units, on a consumption of coal containing about five times this amount of heat energy, and the machinery and line for electrical transmission deliver about one-half of this fifth, or a little more than one-tenth of the energy of the fuel consumed, to the distribution lines at the receiving station. A delivery of one-tenth of the energy of fuel at the point of use, after a long transmission, may have a limited application for power purposes alone, but can never be of material importance for heating purposes. It may now well be asked whether the power driven dynamo, with its connecting transformers, line and converters, is the best available means for the transfer of energy over long distances. Can the gas engine, the dynamo, the step-up and step-down transformers, the line and the rotary converter, or any of them, be replaced in long-distance power transmission by other devices that will give either a high efficiency in the transfer of energy from coal pit to consumer, or a lower first cost for the complete equipment? As has been seen, coal gas contains fully one-fourth and fuel gas eight-tenths of the heat units found in the coal from which it is produced, and it may be possible to transfer either, or at least one, of these gases directly to the points where power and heat are wanted, there to be expected to drive gas engines, either with or without dynamos, for power, or burned directly, for heat. Starting with a plant for gas production at the coal mines, the system of electrical transmission includes gas engines, dynamos, two sets of transformers, line conductors, and, usually, rotary converters in its equipment, whether the energy is to be used for either mechanical power, heating, or both.

To compare readily the relative amount of equipment necessary for the electrical and the pipe line system of transmission and the ratio between gas consumed and energy delivered by each, it is convenient to assume a case of definite power delivery over a fixed distance. The following estimates are, therefore, based on a delivery of 10,000 H. P., or of sufficient gas to supply that work, at a point 150 miles from the place of production. Taking up at first the case of electric transmission of power generated by gas engines, the high efficiency of 80% may be assumed for the line conductors, 95% for transformers, 90% for dynamos, and 90% for rotary converters. The delivery of direct current for general purposes at the place of use of these assumptions is, therefore, $.85 \times .95 \times .90 \times .90 = .62$ of the mechanical energy supplied by the gas engines to drive the dynamos.

The quantity of gas consumed by the engine is, therefore, found to be the equivalent of $10,000 \div .62 = 16,129$, or 16,129 H. P.; for a delivery of 10,000 H. P. at the rotary converters, 10,000; step-down transformers, $10,000 \div .9 = 11,111$; step-up transformers, $11,111 \div (.9 \times .885) = 13,764$; dynamos, $13,764 \div .95 = 14,490$; and gas engines, $14,490 \div .9 = 16,100$ H. P. The total combined capacity of machine equipment is, therefore, $10,000 + 11,111 + 13,764 + 16,109 + 14,490 = 65,465$ H. P. To transmit the electric energy from the step-up transformers at the generating plant to the step-down transformers at the receiving station copper conductors must be erected, and their weight, for a given percent or less, will vary inversely as the square of the electric pressure at which the transmission takes place. It is, therefore, desirable, for economy of conductors, that the volts at which the transmission takes place be as high as practical. At the present time one electrical transmission is being carried on at 40,000 volts over a line surrounded by the dry air of a high altitude, in California, but it remains to be proved that so high a pressure is practical on a line that must encounter the moist air and rainy weather common over a great part of the country. To make as favorable a showing as is practical for the electric system, the transmission for the present case is assumed to be carried out at a pressure of 30,000 volts, though it is by no means certain that so high a pressure would be practical on a line 150 miles long in the climate of the central and east-

ern part of the United States. It was found above that the step-up transformers at the generating station had a capacity of—that is, would deliver to the line—13,764 H. P., which corresponds to 10,266,265 watts, so that at 30,000 volts the current will be equivalent to 342 amperes. On the three-phase system the weight of copper necessary to transmit the 10,266,265 watts a distance of 150 miles at 30,000 volts and an efficiency of 85% is 2394 tons of 2000 pounds each. A fair weight for the complete machine equipment of 85% is 2394 tons of 2000 pounds each. A fair weight for the complete equipment of gas engines, dynamos, transformers, rotaries and fittings may be taken at 100 pounds per horse power capacity, so that the total weight of machinery will be $(65,465 \times 100) \div 2000 = 3273$ tons.

To sum up the case for the electric transmission, each horse power hour delivered at the place of use requires the consumption of gas sufficient to produce $16,100 \div 10,000 = 1.6$ horse power hours at the engine; each capacity of delivery makes necessary the installation of $65,465 \div 10,000 = 6.5$ horse power capacity of machinery, weighing about $6.5 \times 100 = 650$ pounds, and $4,788,000 \div 10,000 = 478$ pounds of copper conductor. Allowing a consumption of 18 cubic feet of gas, containing 650 heat units per cubic foot, or a proportionately larger consumption of gas having less heating power, per brake horse power hour delivered at the gas engine, the heat units in gas consumed for each horse power hour of 2545 heat units, supplied to consumers at the point of the distribution, is $650 \times 18 \times 1.6 = 18,720$. The electric transmission can, therefore, deliver to the consumer for heating purposes but $2545 \div 18,720 = .13$ of the heat contained in the gas consumed. So long as gas is consumed quite near the point of its production the heat units obtained per cubic foot of gas is a matter of secondary importance, but when it is desired to transmit gas to a great distance the efficiency of the transmission will depend, in large measure, on the heating of the gas consumed.

The fuel gas contains only about 140 heat units per cubic foot, and nearly 90 cubic feet are used in the gas engine per brake horse power hour delivered by it. This would require the consumption of 1.6 times the amount of gas necessary to develop the 10,000 H. P. at the end of the 150-mile transmission, with a line of 40-inch pipe, weighing 52,000 tons. So low an efficiency, coupled with so heavy a pipe line, seems to make the fuel gas impractical for long transmission through pipes. The coal gas, or that containing about 650 heat units per cubic foot, will yield a horse power at the engine shaft of less than 18 cubic feet of gas per hour, and to develop 10,000 electrical horse power at the terminals of dynamos driven by gas engines, the engines must be supplied with $10,000 \times 18 \div .9 = 200,000$ cubic feet of gas per hour, the efficiency of the dynamos being 90%. To transmit this 200,000 cubic feet of gas per hour through a steel pipe of 20 inches diameter there must be expended somewhat less than 1000 H. P. at the gas generating plant for pumping. The total gas consumed in terms of that necessary to produce 10,000 H. P. at the engines is, therefore, $10,000 \div .9 + 1000 \div 10,000 = 1.21$ times as much.

The weight of a steel pipe 20 inches in diameter and 150 miles long, of plate ¼ inch thick, is about 41,600,000 pounds, or 20,800 tons.

The gas engine capacity required for pumping gas and driving dynamos is $10,000 \div .9 + 1000 \div 12,100$ H. P. Dynamo capacity is 10,000 H. P., making the total machine capacity $12,100 + 10,000 = 22,100$ H. P. Allowing 100 pounds to the horse power, the total weight of machinery is $22,100 \times 100 = 2,210,000$ pounds, or 1105 tons. The weight of machinery per delivered horse power is $2,210,000 \div 10,000 = 221$ pounds, against a weight of 650 pounds in the electrical transmission system. Deducting the weight of machinery for the gas transmission from the weight for the electric shows an excess for the electric system of $650 - 221 = 429$ pounds per horse power delivered to consumers, and this difference in machinery weights is mostly made up of electrical equipment. The electrical system also requires 478 pounds of copper conductor, which is approximately of the same value per pound as electrical machinery, so that the excess of the electrical equipment over the machinery for the gas pipe line may be fairly taken as equivalent to $429 + 478 = 907$ pounds of copper per delivered horse power. The gas transmission requires, however, $41,600,000 \div 10,000 = 4160$ pounds of steel pipe per delivered horse power, and this is the equivalent of about $4160 \div 6 = 693$ pounds of copper at market prices. The cost of the excess of equipment for the electric system over that of the gas pipe line complete may, therefore, be measured by the value of $907 - 693 = 214$ pounds of copper per delivered horse power. As the electrical transmission delivers as electric current to the consumer 1 H. P. for each 1.6 H. P. developed at the engine, its efficiency is $1 \div 1.6 = .62$, while the efficiency of the gas transmission system referred to the engine production is $1 \div 1.21 = .82$.

These figures for efficiency refer to the final delivery of energy for each system in the form of direct current. If the transmitted energy is to be used for heating, the electric system will deliver to the consumer about 13%, and the pipe line system, by applying gas, about 90%, of the heat units from the total gas consumed.

Treating Non-Smelting Ores in South America.

The Huarhaca Company of Bolivia, and at Huantajaya, Cerro Gordo and Santa Rosa, in the province of Tarapaca, Chile, buy the ores outright at prices lower per ounce for the silver in low-grade ore than in rich ore. Ore containing more than thirty-five ounces per ton is usually treated by amalgamation; ore from thirty-five ounces down to eighteen ounces per ton, by the ordinary process of extraction by hyposulphide of soda without using sulphate of copper.

The process of amalgamation in use is a fusion of the old Peruvian system with the old Washoe system. The ore is ground to the fineness of a mesh of from twenty to forty to the inch, and then removed to an amalgamation barrel revolving on an eccentric axis, a jiggling as well as circular motion being imparted to it. Here the ore is mixed with water, salt, copper sulphate, iron sulphate, mercury and zinc amalgam. When the amalgamation is complete the mass is allowed to settle, the mud run off by a pipe placed about a foot from the bottom and the amalgam run off at the bottom and retorted, the silver being afterwards melted into bars. An extraction of about 95% is usually obtained.

In the usual method of lixiviation of silver ores in Chile no copper sulphate is used, the hyposulphide of soda alone being found sufficient to dissolve the silver chloride in the ore. The ore is brought to the mill from the adjacent mines in sacks on mule backs, and, after weighing, is dumped into the sampler, consisting of a hopper having at the bottom two exits, one 9 inches square and the other 2 inches square. Through the large exit the ore passes down a chute to the yard, while some of the ore passes through the small exit down a 2-inch pipe from which a branch pipe leads back to the ore chute, so that the small quantity of ore passing down the 2-inch pipe is divided into two parts, one part going back to the chute and the other part to the sample bag. In this way the whole shipment is sampled; the sample thus obtained is taken to the sampling room and an average portion crushed fine on a circular iron plate by an iron hand pestle weighing about 300 pounds. To work the pestle requires strength and skill, a side circular motion being used, causing it to gradually travel round the plate and to the center. With a skilled hand a sample can be crushed and ground fine enough to assay in five minutes. The site of the mill is usually on terraces on the side of a hill, in order to save handling. The ore is shovelled from the yard through hoppers into ball-mills, of which there are usually two. Here the ore is ground to a fineness varying with the nature of the gangue; in Tarapaca, where the gangue consists of calcite and clay, coarse grinding is the rule. On passing out of the ball-mill the ground ore is removed by means of a screw to an endless chain of buckets and emptied into a revolving calciner. The weight of ore each bucket will carry is known, and an amount of salt, calculated at about 4% of the weight of the ore, is added by a workman stationed there. None of the mills have any automatic arrangement for feeding the salt, partly owing to the cheapness of labor. The ore is heated to a reddish yellow heat, sufficient for good chlorination, without volatilizing the silver. Contrary to expectation, the silver chloride ores, if treated alone, are not so well adapted to the process as the sulphide ores, as salt does not readily evolve chlorine at a low heat unless acid fumes exist in the furnace to decompose it. When silver chloride ores are treated alone, the change to the soluble form only takes place at a temperature sufficient to volatilize the silver chloride; it is customary to mix the chlorides with the sulphides for the sulphurous acid evolved from the sulphides, both the silver sulphide and the insoluble silver chloride being converted into the chloride soluble in hyposulphite of soda.

After chlorination, the ore is removed in trucks to the cooling floor. When cold, the ore is removed to the lixiviation vats, where the ore is first washed with cold water to remove the salt and all soluble lime and copper salts, the presence of lime being injurious, as it precipitates the silver among the ore after its solution in the hyposulphite. The ore coming from the furnace is usually analyzed for the amount of caustic lime it contains, and, calculating the weight of ore in each vat, a washing of weak sulphuric acid is given to it in sufficient quantity to neutralize the lime. After being given one acid wash and three washes with water, the solution is run on in three washings, lasting about twelve hours each, generally from below, as it is found to penetrate the ore better from below than from above. The strength of the solution is about 1%.

The precipitation is carried out by means of sodium sulphide, manufactured at the mill by blowing steam into a solution of caustic soda mixed with sulphur powder. Generally the sodium sulphide is added in such quantities as to leave some silver still in solution, because the precipitate subsides quicker under those conditions and allows the same solution to be used over and over again, precipitating insoluble silver sulphide among the ore if it contained an excess of sodium sulphide. Owing to the presence of salt, the chloride of silver is found to partially dis-

solve out of the ore with the first washing with water, and the silver is precipitated from this salt solution separately. The same solution of hyposulphide can only be used about six times, depending on the richness of the ore, for, although the soluble salts are removed from the ore by the preliminary acid and water washings, in time it becomes saturated with sodium chloride and weakened in power from the addition of sodium sulphide in the precipitation of the silver from its soluble chloride form as the insoluble sulphide.

In using ball-mills care has to be taken to use iron balls in good condition, otherwise they become chipped in grinding the ore, resulting in the intermingling of pieces of metallic iron with the ore and consequent precipitation of metallic silver among the ore itself in the lixiviation vat. The precipitation vats are of wood, 10 feet high, 4 feet wide at the top, 5 feet wide at the bottom, and provided with two laps, one for running off the solution and the other for running off the precipitate. The precipitate of black silver sulphide is run through a sludge pipe to filter presses, where it is pressed into cakes and finally dried in a hot room. When dry it is placed in sacks and shipped to England. All the mills have a chemical laboratory and assay office, where every parcel of ore purchased is sampled and assayed, and check assays and tests are made from each department of the works. A sample of the chlorinated ore is taken every day fresh from the furnace, an assay made to show whether any volatilization of silver has occurred, and part of the sample is washed with acid, water and fresh hyposulphite solution. If the silver chloride is readily extracted, it is concluded that the chlorination of the ore in the furnace was satisfactory. An assay of the tailings is taken at the conclusion of each treatment. If more than two ounces of silver per ton are found to remain, two samples are taken, one washed with pure hyposulphite and one with the solution in use in the works. If more silver is extracted by both solutions, the ore is given another washing; if only the pure hyposulphite extracts silver, the works solution is charged; if no silver is extracted, as sometimes happens, it has generally been through carelessness in the works in the preliminary acid and water washings. The chloridized ore is daily tested for free lime and daily tests are made of the strength of the hyposulphite solution by titration with iodine. The strength of the solution is never allowed to sink below one-half per cent.

Coarse Concentrating Without Sizing.

S. W. Traylor, traveling representative of the Colorado Iron Works, Denver, Colo., who gives special attention to the operating of concentrating machinery, furnishes the MINING AND SCIENTIFIC PRESS with the following report on a test run of Georgia ore over a Bartlett concentrating table. It will be noted that the test was one of coarse concentrating without sizing:

As illustrative of what can be done in the way of effective concentration of coarsely crushed ore on tables without sizing, the following cases are briefly presented, giving some interesting results we have recently obtained with ores offering, it must be said, conditions quite unfavorable to good concentration under any system. By coarse concentration is meant as coarse as will secure a satisfactory freeing of ore minerals from gangue and included all sizes suitable for jigging, up to at least 7 millimeters or $\frac{1}{4}$ inch. The test was on Georgia ore carrying gold, silver, copper, lead and zinc, consisting of iron pyrites, copper pyrites, galena and zinc blende in small quantities quite finely disseminated in a hard, tough quartzite. The zinc occurs, it will be observed, in much larger quantity than any of the other metals and the object sought in the concentration was to secure the largest possible saving of the valuable metals, copper, lead, gold and silver, with the least amount of zinc in the concentrates, so that the latter would escape "docking" for zinc at the smelter.

The ore was crushed to 8 mesh with jaw crusher and two sets of rolls and then treated on a Bartlett table without any sizing, with the following results:

	Ore	Concentrates	Middlings	Tails	Per cent saved in concentration. Con- 21.8% of ore.
Copper	2.65%	9.30%	2.00%	0.90%	76.5%
Lead	2.90%	12.50%	0.30%	0.20%	94.0%
Zinc	5.20%	9.10%	5.00%	4.00%	38.1%
Gold	0.18 oz.	0.72 oz.	0.06 oz.	0.03 oz.	92.8%
Silver	1.22 oz.	4.08 oz.	0.56 oz.	0.41 oz.	72.9%
Weight	4850 lbs.	1059 lbs.	468 lbs.	3323 lbs.	
Per cent.	100	21.8	9.6	68.6	

By recrushing the 468 pounds of middlings and re-treating on the table, additional concentrates would, of course, be obtained and the above percentage of metals saved would be correspondingly increased.

Colorado Mine Report for 1900.

H. A. Lee, Colorado's Commissioner of Mines, in his biennial report, notes the prevalence of fatal accidents, and cites as reasons therefor, "incompetent management, incompetent miners, lack of discipline, carelessness." Like other States, the laws of Colorado allow any one to manage a mine and do not place any requirements of ability or experience on either miners or mine managers in any degree sufficient to make life safe. The Colorado official urges the more detailed enactment of measures to enforce good timbering; removing of old timbering; to limit the amount of powder and oil stored at any given point more thoroughly than it is limited at present.

According to Commissioner Lee's report, in 1899 and 1900 there have been 1217 accidents in the metalliferous mines of Colorado, which he figures out to be a percentage of 15.32 injured out of every 1000 miners at work, or $1\frac{1}{2}\%$ of all miners engaged at labor in the State. The fatal accidents during the past two years have been 210, which is 6.24 fatal accidents in every 1000 miners at work. The accidents classed as "non-fatal" foot up 1007. Lack of good timbering is asserted to be a "fruitful" source of accident.

The cost of the department to the State has been \$24,000 for the biennial period, about half as much as the cost of the California State Mining Bureau for the same time. The number of men employed in mining in Colorado is given as 40,111 and in the detailed list of counties the number of counties employing more than 1000 men is thus shown: Arapahoe, 2093; Boulder, 1597; Clear Creek, 2012; Gilpin, 3124; Lake, 7470; Ouray, 1897; Pueblo, 2084; Pitkin, 1560; San Juan, 1405; San Miguel, 1723; Teller, 7920. These and all other counties make a total of 40,111.

Parts of two tables submitted with the report are as follows:

TOTAL METAL PRODUCTION IN COLORADO.

	Gold.	Silver.	Lead.	Copper.
1870.....	\$223,126,729	\$340,254,263	\$93,302,223	\$12,611,336
1880.....	3,015,000	660,000	—	20,000
1885.....	3,200,000	15,055,302	3,585,939	184,000
1890.....	4,200,000	13,014,927	4,345,000	127,435
1895.....	4,150,000	19,665,245	4,883,200	945,000
1899.....	13,559,954	11,683,232	2,954,714	659,050
1899.....	26,508,675	13,771,731	6,170,765	1,869,169

PRECIOUS METAL PRODUCTION FOR 1899.

County—	Gold.	Silver.
Boulder.....	\$ 547,858	\$ 45,501
Clear Creek.....	546,824	895,427
Gilpin.....	1,996,060	202,960
Lake.....	2,196,497	4,307,704
Ouray.....	1,694,940	1,397,862
San Juan.....	996,273	710,108
San Miguel.....	1,376,704	719,961
Teller.....	16,058,564	49,033

These and all other counties of the State making these 1899 totals: Gold, \$26,508,675; silver, \$13,771,731; lead, \$6,170,765; copper, \$1,869,169; total for 1899, \$48,320,341.

Magnetic Separators.

TO THE EDITOR:—Regarding the inquiry from Wallace, Idaho, relative to magnetic separation, an ordinary fixed magnet placed between crusher and bin is entirely inadequate to take out the steel or iron which may pass with the ore, for the reason that there is no means of detaching the attached pieces except by hand. With a rotary drum the material is discharged automatically. The magnetic field in the fixed magnet is so extremely small, weak and uncertain that it is not at all reliable. There must be a live current passing through a fixed magnet the same as through the revolving drum, and there is not very much difference in the expense if the magnet is made large enough to handle the ordinary output of a mill. The magnet for this purpose is better made of very soft wrought iron or soft annealed steel wrapped with six or ten coils of insulated wire. I do not think that Mr. Edison has any device for this purpose, except a fixed magnet for separating iron ore, which is only successful when six or eight of these magnets are placed one over the other. The expense of this apparatus would be very much in excess of the rotary drum.

New York City.

C. G. BUCHANAN.

Patent for Co-owners.

Where several persons own equal interests in a group of locations and seek to obtain U. S. patents, can such patent be obtained in the joint names of all? Or must property be conveyed to one individual and patent issue in his name? If patent will issue in the names of several, is it not best to have all join in granting power of attorney to one person to do all that is requisite?

Austin, Nev., Dec. 26.

Assuming that the above questions apply to a case where the claim to be patented is not owned by a corporation, it is the custom in such instances as the one cited to select one of the co-owners to act for all, and a special power of attorney is usually filed with the application; but this is not necessary. The department ordinarily recognizes such an application, signed by one joint owner in behalf of himself and the other owners. The patent issues in the name of the applicant.

"The Miner's Inch," in Canada.

So much has been said in these columns about the "miner's inch," that it would appear unnecessary to make further reference to a subject that, so far as the west half of the United States is concerned, is one of general understanding, a part of that understanding being knowledge of the fact that the term is indeterminate, and means different quantities in different States.

Regarding the "miner's inch," in British Columbia, in a paper entitled "The Miner's Inch and the Discharge of Water Through Various Orifices Under Low Heads," Thos. Drummond writes as follows:

The miner's inch of water, it may be explained, is an arbitrary module adopted in mining districts for selling water. It is variously defined as being the amount of water discharged by an orifice 1 inch square, or an equivalent fraction of a larger orifice with a head of from 6 to 9 inches. The thickness of the orifice is usually 2 inches.

One great difficulty is that it is a variable quantity depending upon the specified head, and therefore all such modules should also define the flow in cubic feet per minute.

In British Columbia it is defined as being 1.68 cubic feet of water per minute, or that quantity of water which will pass through an orifice $\frac{1}{2}$ inch wide, 2 inches high and 2 inches thick, with a constant head of 7 inches above the top of the orifice, and every additional inch shall mean so much as will pass through the said orifice extended horizontally $\frac{1}{2}$ inch. As a definition, unfortunately, this is completely wrong. In the first place, widening the orifice as above changes the coefficient of discharge, and therefore the discharge itself. In the second place, this orifice actually discharges 2.147 cubic feet of water per minute, instead of 1.68 cubic feet, and this brings out a curious point referred to above, that certain shaped orifices, with a thickness of 2 inches, run full like a short tube, the vein is not contracted, and they actually give a greater discharge than they are supposed to give. The orifice in question runs full in the horizontal and vertical positions with heads of from 10 to 12 inches.

A 1x2-inch orifice 2 inches thick is just on the margin between flow with contraction and full bore. If fixed in the vertical position, with longest diameter vertical, the vein contracts. If fixed in the horizontal position, with the longest diameter horizontal, it will also contract, but if rubbed with the fingers on the edge it will run full for a time and then contract again. If kept running full in this way it will discharge about 1 cubic foot of water per minute more than when full contraction takes place.

There are practical difficulties in the way of delivering absolutely exact quantities of water; and they cannot be measured out as a pound of tea is weighed over the counter. The definition of the module or unit, however, should be correct within a reasonable limit of error. If it is a definition of a single miner's inch from an orifice of 1 square inch, it should go no farther. If the inch is defined as being some practical part of the discharge from a larger orifice, it should go no further than the capacity of that orifice, and as it is an unknown quantity to the outside world the discharge should be given in cubic feet per minute. Convenient discharges are $\frac{1}{2}$ and 2 cubic feet. The flow under low heads is irregular. Heads of 1 foot or more are not convenient because the water is delivered from ditches or flumes where the depth of water is never great. The question thus resolves itself into a choice of a standard module or unit from a flow under two conditions:

1. With a low head of 6 $\frac{1}{2}$ inches above the center of the orifice, giving a discharge of $\frac{1}{2}$ cubic feet per minute, with the advantage that it is already partially recognized as the miner's inch, and with the disadvantage that the flow is irregular.

2. With a head of 11 $\frac{1}{2}$ inches above the center of the orifice, and a discharge of 2 cubic feet per minute, the flow being much more regular, but the quantity discharged new to the people.

Definitions of both inches are given, and a choice can be made, but the author favors the last.

Definition No. 1 of the miner's inch: The water taken into a ditch or sluice shall be measured at the ditch or sluice head. It shall be taken from the main ditch, flume or canal, through a box or reservoir arranged at the side. The orifice shall be fixed vertically at right angles to the delivering waterway, and the edges and corners shall be sharp. The vein shall be fully contracted. The distance between the sides and bottom of the orifice and the sides and bottom of the waterway shall be at least three times the least dimension of the orifice. The orifice shall discharge freely into air.

One miner's inch of water shall mean $\frac{1}{2}$ of the quantity which will discharge through an orifice 2 inches wide and 2 inches thick, made in a 2-inch plank, planed and made smooth. The water shall have a constant head of 7 $\frac{1}{2}$ inches above the center of the orifice. It shall mean a discharge of $\frac{1}{2}$ cubic feet per minute.

Definition No. 2: The first part is precisely the same, the latter part is changed as follows: One miner's inch of water shall mean $\frac{1}{2}$ of the quantity which will discharge through an orifice 2 inches wide,

and 2 inches thick, made in a 2-inch plank, planed and made smooth. The water shall have a constant head of 11 $\frac{1}{2}$ inches above the center of the orifice. It shall mean a discharge of 2 cubic feet per minute.

A 1-inch orifice may run full, but no experiments were made on this point.

These discharges are from a standard brass orifice, and are actually 1.478 and 1.997 cubic feet per minute. The discharge through a wooden orifice 2 inches thick is slightly greater than for a standard orifice, so that these discharges should be almost exactly $\frac{1}{2}$ and 2 cubic feet per minute.

No attempt was made to reduce the observations to a common temperature. The temperature for the brass orifice varied between 31.7° and 46.5° F., a range of 9.5° with an average temperature of 48° F.

The temperature for the wooden orifices varied between 45° and 50° F., with an average of 48° F. The mean temperature for the whole was 45° F.

Every precaution was taken to remove disturbing effects, and to make the work as accurate as possible.

Altogether, some 235 observations were made in sets of from 2 to 5, involving a considerable amount of labor, but in the work and calculations.

Leaching Copper Ores.

A valuable article in last week's issue gives the latest concerning the leaching of copper ores, and, in general, methods of wet extraction.

There are ordinarily three classes of processes for the wet extraction of copper. In one the sulphide ores are roasted in heaps, driving off most of the sulphur, and converting the copper into sulphate which is leached out with water. Sometimes the lixiviated residue is re-roasted with the addition of pyrites, and again lixiviated, the extraction thus being made more complete. This system, or class, includes the Longmaid, Henderson and Monnier process, so-called, or any way in which the copper is rendered soluble by subjecting the sulphide ores to a preliminary roast to remove most of the sulphur, subsequently adding a portion of common salt to the charge in the roasting furnace, by which the copper is converted into a chloride, or, with sulphate of soda, thus forming sulphate of copper.

Another class comprises those methods in which free hydrochloric acid, or sulphuric acid, is made the solvent for copper found in oxidized or roasted ores. Where the hydrochloric or sulphuric acids are waste products such process might do, but, ordinarily, that method, while simple and efficient, is costly. There is a cognate method whereby the oxidized and moistened ores are exposed to the slow action of sulphurous acid mixed with air, thus forming soluble sulphate of copper. The copper is precipitated from its solution by the use of metallic iron; although milk of lime has been used as a precipitant, in such a case oxide of copper is produced.

A third class of wet processes of copper extraction comprises such methods as the one in which a hot solution of ferrous chloride, with common salt, is used to chloridize the oxidized copper and convert it into a mixture of cupric and cuprous chlorides, which, though almost insoluble in water, are dissolved by the help of the sodium chloride. In the Hunt & Douglass process, from this solution the copper is precipitated by metallic iron, thus reproducing the ferrous chloride, which is used as the solvent. This method is also suited to the extraction of copper from oxidized ores containing copper carbonates and the hydrous silicate of copper (chrysocolla). It is pointed out by Furman that when applied to the treatment of ores containing silver, the use of the bath of ferrous chloride has, in common with the method of roasting with salt, the disadvantage that it converts the silver into a chloride which is soluble in the strong solution of sodium chloride, and is then with difficulty separated from the chlorides of copper. This has been successfully overcome by a method which depends upon the action of sulphurous acid on copper sulphate, in solution with enough chlorine to produce cuprous chloride. This pure copper salt (which is insoluble except in a strong chloride solution) readily separates on the injection of sulphurous acid gas from a roasting furnace. If the gas is not diluted by too much air, acid is simultaneously generated in excess of the equivalent quantity, due to the unavoidable, though desirable, presence of free oxygen in the injected gases. The subchloride is susceptible of being reduced by iron to cement copper, and the chlorine recovered as chloride of iron, or to suboxide by lime, and the chlorine recovered as calcium chloride, the gold or silver remaining with the iron oxide in the matte or ore residues.

Always Advisable.

Is it necessary to record assessment work on a quartz mining claim in this State to hold it legally?

Baker City, Or., Dec. 30.

No. But to make affidavit of the fact that the work necessary to hold the claim was done, and to duly record it, would furnish direct evidence of the fact that might save expense and loss later on. It is always advisable to make such record, even though, as in Oregon, there is no State law requiring such record.

The Cost of Mining*

This is something which can never arbitrarily be determined until the character of the mine has been demonstrated. The width and length of the ore shoot must be known, and the character of the walls ascertained. The probable quantity of water which will have to be handled is always problematical, and, as a matter of course, the character of the walls and vein material itself will determine the method and expense of timbering. It is not uncommon to hear it said that in California mining and milling can be accomplished, under favorable conditions, for less than \$1 per ton; but these conditions so rarely obtain, even in California, as to scarcely be worth mentioning, for they by no means constitute or illustrate the typical features of California mining. There are mines in slaty rocks, not particularly hard, where the veins are 3 to 7 feet in width, which, being worked through tunnels and having free water power, are operated at a very low cost; but even this class of mine does not represent the majority—indeed, such constitute a very small minority.

In the greater number of mines in California operations are conducted through shafts, which necessarily increase the expense of mining. In the central gold belt the mines vary so greatly in size, depth, character of ore and wall rocks, and quantity of incoming water, that a statement of cost would convey but little information, and comparison would be valueless unless accompanied by a complete knowledge of existing conditions and an itemized cost sheet. At a number of larger mines elaborate cost sheets are kept, and to a number of these the writer has been given the freest access. The cost of mining in the larger mines, under ordinary conditions, may be fairly represented by the cost sheet of the Wildman Company, at Sutter Creek, Cal., which has been kindly furnished by the superintendent, John Ross, Jr.

Detailed average cost of mining one ton of ore for the years 1896, 1897, 1898, at the Mahoney mine of the Wildman Company:

	Total Cost for 134,886 Tons.	Cost per Ton. Cents.
Timbers.....	\$24,499 18	18.163
Spilling.....	4,913 05	3.642
Lumber.....	1,017 57	.755
Charcoal.....	1,242 01	.92
Candles.....	1,840 59	1.365

Totals.....	\$42,667 79	31.628

The above cost includes all repairs and equipment.
JOHN ROSS, JR., Superintendent.

* California Mining Bureau Bulletin No. 18.

OWING to the funds appropriated for the field work of the California Mining Bureau being exhausted, Mr. W. L. Watts, of the State Mining Bureau, will undertake the examination of oil or mineral lands for mining companies or others who may desire his services.

Mining and Metallurgical Patents.

Patents Issued December 25, 1900.

ORE-ROASTING FURNACE.—No. 664,153; F. W. Holtman, Richmond, Va.

Ore-roasting furnace, having vertical series of beds therein, walls slotted horizontally adjacent to upper surfaces of beds, sleeves and rack bars supported thereby, rake teeth carried by bars, interiorly threaded nuts having integral shank portions connected to sleeves, designed to travel in slots, worm shafts working through nuts, shutters fastened to opposite edges of shank portions of nuts and designed to close slots and slide against outer walls of furnace, as racks reciprocated over beds, means for rotating worm shaft.

ELECTRIC FURNACE.—No. 664,333; J. M. Morehead, Chicago, Ill.

Electric furnace provided with hood having gas-tight sides and top, opening in bottom for removal of product, conductors of opposite polarity projecting through hood, means for embedding skirt of hood in packing material, thereby establishing and maintaining seal for preventing ingress of air to hood, directing and confining gas in hood, means for removing gas from hood.

TREATING WHITE LEAD.—No. 664,437; T. C. Sanderson, London, England.

Improvement in direct treatment of white-lead pulp precipitated from basic acetate solution without intermediate washing, consisting, first, in partially removing mother liquor; secondly, separating remaining mother liquor by adding considerable excess of oil; thirdly, expelling excess of oil and separated mother liquor by pressure in cold; fourthly, reducing proportion of oil in final product to required limit.

BATH FOR RENDERING ORE FRIABLE.—No. 664,488; K. Miller, London, England.

Composition of bath for rendering friable red-hot ore dipped therein, consisting of mixture of solution of equal quantities of sodium carbonate and caustic soda having density of 15° Baume, and about 1½ peroxide of hydrogen.

MACHINE FOR COLLECTING PRECIOUS METALS FROM RIVER BEDS.—No. 664,626; J. R. Dake, Merrill, Wis.

In a machine for collecting gold from water beds, frame, float, means for anchoring frame and float, air chamber rigidly connected to frame, shaft mounted in frame, current operated wheel mounted on shaft, sprocket wheel on shaft, guide board having

swinging connection with shaft, sprocket wheel carried at outer end of guide board, sprocket chain extended around sprocket wheels, buckets on chain, means for raising and lowering guide board, swinging sluice into which buckets discharge, means for continuously swinging sluice.

PROCESS OF EXTRACTING PRECIOUS METALS FROM THEIR ORES.—No. 664,060; J. P. Schuch, Jr., Cripple Creek, Colo.

In combining crushed ore with cyanide solution while both are in warm condition, mechanically mixing ore and solution by agitation simultaneously with commingling thereof, charging mixture during agitation with hot air, finally separating ore and slush or pulp from metal in solution.

TRIPOD.—No. 664,502; P. H. Reardon, San Francisco, Cal.

In a support for rock drill, combination of cylindrical head comprising two parts A and A', each provided with an integral arm, leg hinged between arms, each of parts A and A' having at its outer end an integral boss, cap adjustably secured to each boss, leg hinged to each cap and movable at an angle to plane of movement of cap, means for securing legs.

PROCESS OF EXTRACTING COPPER.—No. 664,537; J. Douglas, New York, N. Y.

Process of reducing copper ore and matte, which consists in electrolyzing solid cuprous chloride, employing gases evolved in treatment of copper ore and matte, employing electrolyte resulting from electrolyzing of solid cuprous chloride as solvent for cuprous chloride so produced, recovering copper from solution by electrolysis.

ORE SEPARATOR.—No. 664,635; A. C. Hartung, Galena, Kans.

Combination with rotating table, scraper arranged over and adapted to work on table, standard secured to scraper and adapted to slide vertically, support or bearing for standard, lever having jointed connection with standard and adapted to swing in vertical plane, device for locking lever in any adjustment.

ELECTRO-MAGNETIC ORE SEPARATOR.—No. 664,650; E. Kreuser, Mechernich, Germany.

In an ore separator pair of closely placed co-operating rotary cylindrical electro-magnets recessed at points intermediate their ends for inducing coils, winding of one coil being opposite that of other, whereby magnetic lines of force are produced directly in co-operating magnets, so that path of magnetic flux forms shortest possible closed circuit, and lines of force pass through a single air space constituting magnetic field, connections between coils and source of energy which permits rotation of cylinders and coils therewith.

ORE SEPARATOR.—No. 664,768; A. R. MacDonald, Jr., Montreal, Canada.

A sluiceway for ore separators, comprising sluice; series of depressions formed therein; semi-cylindrical bands extending therefrom, in series, bands extending around lower side of depressions, the ends of bands of alternate series being joined, whereby material passing over sluice will be given backward rotary movement, movement being in opposite directions during passage of successive series of bands.

GRADING AMALGAMATOR.—No. 664,712; A. Z. Baldenebro, Mexico, Mexico.

Apparatus for grading ores, comprising series of funnel-shaped vessels, water-supply pipe leading into each vessel and provided with spraying device adjacent to tapered bottom of vessel, overflow channels connecting vessels, interior lateral channel extending downward from inlet of each vessel along inclined wall thereof and tapering toward its lower end, out-

let of channel terminating above spraying device, forward wall of channel having convex inner face corresponding with opposing concave inner face of receptacle forming rear wall of channel, valve-controlled pipe leading from side of each vessel near bottom, channels to which pipes lead, and valve-controlled outlet for bottom of each vessel.

Rhodium Alloys.

A specimen piece of pure rhodium wire, exhibited by Heraeus of Hanau, in Paris, indicates that this metal has only quite recently been prepared in sufficient quantities to study its metallurgical character, although platinum-rhodium thermo-couples have been used for several years, says Engineering. Great attention is now being paid to the nature of alloys, and the rhodium alloys are not less interesting than others. According to Dr. Rossler of the gold and silver refinery of Frankfurt-on-the-Main, rhodium appears to have been confused with iridium in some cases. We have two groups of platinum metals, the one with a specific gravity of about 12, the other with a gravity of about 22. Rhodium belongs to the first group, iridium to the second. If five milligrammes of rhodium are fused with one gramme of silver, melted in lead, the regulus resulting from cupellation is not as bright as silver, but dim gray. When the grain is dissolved in nitric acid this gray film disintegrates into fine, glittering scales, which float in the solution. These scales are fine hexagonal crystals of pure rhodium. When more rhodium is applied it is afterwards reobtained in the amorphous state. There is, therefore, no alloy of rhodium and silver, and rhodium is not soluble in silver, but it is soluble in lead. Iridium behaves similarly. The silver-iridium grain, resulting when the above-mentioned proportions are observed, has the bright color of silver, the much heavier iridium particles are imbedded in the bottom of the grain, and when nitric acid is applied as solvent the iridium is again found crystallized, but the crystals rapidly sink in the solution. Larger proportions of iridium are not dissolved by the silver, and remain amorphous. On continued heating the iridium becomes oxidized. The case is quite different with silver and platinum. These two metals alloy, and when such alloy, containing only a small proportion of platinum, is dissolved in nitric acid, some of the platinum, which is itself insoluble in nitric acid, passes into solution with the excess of silver. Further, the platinum residue proves oxidized, and is then soluble in hydrochloric acid. Thus, an observation of Von der Ropp's is confirmed, and it has in fact been known that the anode mud, obtained in silver refineries from silver containing both gold and platinum, on the Moebius process, leaves an oxidized platinum residue behind, soluble in hydrochloric acid. Ropp found water, oxygen and nitrous acid in this residue. The rhodium gold alloy resembles this platinum silver in these respects. It is prepared like the rhodium silver alloy, and dissolves in aqua regia with a darker color than gold alone would give. The properties of rhodium are evidently influenced by a large excess of gold. If more rhodium (above 5%) is forced into the gold, which requires long-continued fusion, the excess of rhodium is afterwards found in beautiful star-shaped or feathery needles, easily distinguished from the gold by their gray color. Gold and rhodium seem to form a real alloy, but it has not been isolated so far. To investigate the question further, Rossler prepared alloys of rhodium with bismuth, tin and antimony. The metals have to be heated above their melting points for some time. Bismuth takes up 5% maximum of rhodium. When the excess of bismuth is extracted with cold nitric acid, crystals of Rh Bi₄ remain behind, which are themselves soluble in boiling nitric acid. The same crystals can be prepared by fusing together the respective proportions of the two metals corresponding to that formula, and those crystals are entirely soluble in hot nitric acid; no bismuth can then be extracted with cold acid. An excess of rhodium is afterwards found in the crystallized or in the amorphous state; the amorphous metal had evidently not been taken up by the fused mass.

Silver Plating Copper Plates.

TO THE EDITOR:—In regard to how copper plates are silver plated, the silver is deposited on the plates by the electro-plating process. A solution is made of the proper proportions of either cyanide or chloride of silver, cyanide of potassium and water. The copper must be thoroughly cleaned, then immersed in the solution, and attached to the negative pole. The sheets of silver called anodes, to feed the solution as the silver is deposited on the plates, are attached to the positive pole. The solution being a conductor of electricity, the current passes through from the anodes to the copper plates, and the silver is deposited. Care is necessary that the proper amount of electric current is used, and everything must be in proper condition to insure success. We are extensively engaged in the manufacture of silver-plated copper mining plates, and would be pleased to have you call at any time and see the process.

E. G. DENNISTON.

743 Mission street, San Francisco.

MINING SUMMARY.

Specially reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

A Mint estimate of the gold and silver production of Alaska for 1900 is: Gold, \$7,771,048; silver, \$197,135, of which total Nome contributed \$5,000,000.

A 30-stamp mill, with room for ten additional stamps, will go in at the Sea Level, near the head of Thorn Arm, on Revillagigedo island, 24 miles from Ketchikan. The new 12-drill compressor for the Julian, Juneau, is going in. The Chicago & Sitka M. Co. of Sitka expect to put in its new mill next spring. A new tram is going in on the Lucky Chance; Supt. E. O. Smith is pushing work.

Ore from a 30-foot ledge, now being developed near Wrangel, shows an average of \$43 to the ton. At a depth of 150 feet a strike of ore which assays \$1500 to the ton is opened up in tunnel No. 2 of the Cracker Jack. On Prince of Wales Island the Mt. Andrews M. Co. has twenty men working on the Lichtenstadter properties; copper ore is being shipped. The Valparaiso Co., at Port Johnson, Prince of Wales Island, recently shipped thirty-one tons ore which returned \$180 to the ton.

It is stated that the output of gold from the Minook mining district, near Rampart City, for 1900 is \$500,000.

Large oil fields are reported found between Dry Bay and Yakutat; a Seattle, Wash., company will develop them. A strike of good ore is reported opened up on Coronation Island.

ARIZONA.

The estimated gold and silver production of the Territory for the year 1900 is given as follows: Gold, \$4,936,000; silver, \$250,000 ounces. The copper output for the year is put at \$30,000,000.

GILA COUNTY.

Returns from a carload of ore recently shipped from the Copper Hill, at Globe, indicate 21.5% copper per ton. The Bernard McCoy estate, consisting of three whole claims and part interest in five others, is sold to C. E. Taylor of Globe. Mr. Taylor will push work on the properties. The balance of the machinery for the Black Warrior concentrator is on the ground and construction work is under way; the new roll, recently put in, is said to be the largest ever placed in a mill in Arizona. The leacher is running, and acid works are the next addition contemplated. B. Haverly is shipping high-grade ore from his claim, adjoining the Black Warrior.

The Black Warrior, Globe, has fifty men working.

GRAHAM COUNTY.

The shipping ores from mines near Clifton average about 12% and the concentrating ores average about 4% copper to the ton. There are about 1200 feet of tunnels, drifts, etc., on the Medler. A tunnel is driven on the Indiana, owned by the same company, the Medler M. Co. The Arizona Copper Co. is putting in a new foundry on Chase creek. Work on the new 200-ton concentrator at Longfellow is progressing favorably. There are estimated to be 100 mines in the Clifton district, with a daily output of \$22,850. Ten cars of cement for use on the new concentrator of the Medler Co. at Clifton are on the ground.

MOHAVE COUNTY.

The New England & Arizona M. Co. will put machine drills in at the Sheeptrail and Homestake mines. The main shaft on the Occident, at White Hills, is down 740 feet on the incline; the mill is running twelve hours per day. The framework for the new concentrator at the Tennessee, at Chloride, is up and ready for machinery; work in the mine is being pushed, and ore from the 400-foot level is being taken out. The Elkhart, after a year's shutdown, has resumed operations; forty men are employed. The 200-ton concentrator is running and shipments of high-grade concentrates will soon be made; T. B. Comstock, manager. H. L. Frank is pushing work on the Mollie Gibson; the shaft, now down 80 feet, will be sunk to the 500-foot level. The Lucky Boy is mining ore running \$300 to the ton in gold, silver and copper. The Philadelphia & Arizona M. Co. is crosscutting on the Minnesota, recently bought from J. Barry; ore from the dump is being hauled to the Merrimac 10-stamp mill, 4 miles away.

The Kingman Sampling Works were burned on the 2nd inst.; loss, \$12,000; the fire originated in cars occupied by drunken tramps.

J. Jackman is driving a tunnel on the old Overland, in the Wallapai mountains, near Mohave. The tunnel is now cutting the ledge at a depth of 75 feet.

SANTA CRUZ COUNTY.

The McKinnin-Davis combination of Colorado Springs, Colo., is pushing work on the Patagonia, near Nogales. The shaft is down 110 feet and the tunnel is in 133 feet. Shipments of silver-lead ore are being made. Owing to a lack of water, the mill at the Tres Amigos mines is closed down. Work in the mines, however, is progressing satisfactorily. The deepest shaft is 130 feet. The ore is said to average \$6 to the ton. A second winze is being sunk. At Washington Camp the big mill is running steadily on ore from the Pride of the West; Supt. E. Gee. The Mowry mill is running satisfactorily. Sixty men are employed.

YAVAPAI COUNTY.

J. M. Sullivan has bonded his partner's interest in the Columbia group (copper). The crosscut tunnel is in 315 feet; the ledge is a contact between slate and porphyry, with iron croppings.

Sinking and drifting are in progress on the Empire group, in Groom Creek district; a new mill is in and running. Three samples of ore from a property 2½ miles east of Cordes recently assayed, respectively, 28.8%, 21% and 9.1% copper to the ton.

The Brookshire and George A. Treadwell mining companies, operating near Jerome, have made final entry of the Missouri, Badger and Cliff groups, consisting of thirty claims. On the old Venezia a crosscut is run to cut the main ledge of the Crook. Air drills are going in on the Lottie, in Big Bug district. A 500-foot tunnel is being driven. The ore body at the bottom of the 100-foot shaft on the Giant Reef at Congress is 3½ feet wide.

The shaft on the Angel is 9 feet deep. R. De Large and Dewey is working on the Omega, Altar and Imperial mines (gold-copper), in the Black hills, 6 miles south of Jerome. The incline shaft is down 80 feet. The ore runs \$19 gold and 4% copper to the ton. O. B. Marshall is crosscutting on his group in Big Bug district.

On the Hamilton, in Big Bug district, the tunnel is in 150 feet, giving a depth of 98 feet. The shaft on the Cypress, in the same district, is down 220 feet. The Butternut is shipping ore. A depth of 550 feet is reached on the Henrietta. Madden Bros. have leased the dump at the mouth of the Tunnen. They are putting up a jig and will begin jigging soon.

Sinking and crosscutting are being pushed on the Mineral Hill, near Huron. The shaft on the Verde Queen at Jerome, now down 250 feet, will be sunk an additional 200 feet. Two wells will be sunk on the Maguire, which are expected to furnish enough water to run the projected 100-ton mill.

CALIFORNIA.

A Mint estimate of the gold production of California for 1900 is \$14,377,186; silver, \$562,293.

The receipts of quicksilver at San Francisco in 1900 and 1899, both years ending November 30, were as follows:

Years.	Flasks.
1900.....	21,136
1899.....	23,819

Decrease, 1900..... 2,683

The following shows the receipts for a number of years ending December 31:

Years.	Flasks.
1899.....	23,893
1898.....	23,371
1897.....	18,143
1896.....	24,617
1895.....	31,519

The exports from San Francisco by sea in 1900 and 1899 were as follows:

Years.	Flasks.	Values.
1900.....	7,034	\$330,026
1899.....	10,130	397,400

In the past year the exports were distributed as follows:

To—	Flasks.	Values.
Mexico.....	4,381	\$203,422
Central America.....	1,464	67,732
Australia.....	150	6,950
China.....	1,000	50,000
British Columbia.....	12	589
Siberia.....	7	343
New York.....	20	1,000

Totals..... 7,034 \$330,026

Up to February, 1899, there had been no shipments to China since 1896, that country in former years having been the largest consumer of the California product. Since 1884 London has been the chief customer in that market. During the year ending December 31, 1899, the exports by sea comprised 4000 flasks to China, 3706 to Mexico, 1780 to Central America, 450 to Australia, 44 to British Columbia, 2 to Siberia, 5 to New Zealand, 50 to Peru and 118 to New York.

AMADOR COUNTY.

Ten stamps are dropping at the South Spring Hill, Sutter Creek. In a cross-

cut on the 400-foot level of the Mutual good ore is opened up; Supt. Porter. Twenty stamps are dropping at the Central Eureka. The new steam hoist is running. Preparations are being made at the Gwin to sink for another level below the 1600-foot level. Eighty stamps are in operation. The monthly output is nearly 10,000 tons of ore. Unwatering and retimbering of the main shaft is in progress at the Bunker Hill. The shaft is pumped out to the 800-foot level, and retimbered for 750 feet. Sinking will begin from the 800-foot level soon; Supt. Downs. Drifting is in progress on the 500, 650 and 1200-foot levels of the Lincoln. The drift on the 650-foot level will be run an additional 200 feet to cut the ore shoot. Winter supplies are in and work will be pushed.

BUTTE COUNTY.

The new derrick for the Hesperian Crude Oil Co., at Richardson Springs, near Chico, is completed.

CALAVERAS COUNTY.

The business and mining men of West Point contemplate a smelter at that place. The shaft on the Ophir, at Carson Hill, is down 300 feet; a 40-stamp mill is projected.

C. C. Clark of the Gold Hill M. Co. states that operations on the Gold Hill (gravel), on Esperanza creek, 8 miles from Mokelumne Hill, will soon begin.

EL DORADO COUNTY.

M. L. Smith has bought a 5-stamp mill near Mosquito, and will put it on the Rosebud, near Fairplay; a steam drill will go in also.

The Eagle G. M. Co., Supt. G. E. Walker, operating near El Dorado, will continue operations through the winter. Monthly clean-ups will be made.

INYO COUNTY.

Work is in progress on the Emily Enot, near Bishop. The Menlo & Belmont group, consisting of seven claims, and the Imperial & Royal and the Empire group of ten claims, in Argus district, are sold to C. A. Burcham for \$25,000.

KERN COUNTY.

The Monte Cristo Oil Co., at Bakersfield, has finished its pipe line. The Globe Oil Co. is figuring on building a pipe line from its wells to the Peerless works, and making use of that company's line to the railroad. The Kern King Oil Co. expects to begin drilling soon at McKittrick. The well of the Edgar Oil Co., on 18, 28-28, in Kern River district, is finished at a depth of 1340 feet. McKittrick well No. 2 is down 450 feet. The S. W. quarter of the N. E. half, 11, 28-27, is sold to the Provident Co. for \$11,000. The Valley View Oil Co., of Selma, will begin work on 12, 28-27, as soon as a rig is put in. The Cal. & Colo. Oil Co., of Colorado Springs, Colo., will work the S. W. quarter of the N. W. quarter of 35, 12-24.

Near Sunset, Clark, Bryan & Wilson have struck oil sand at a depth of 500 feet.

The Edgar Oil Co., drilling on 18, 28-28, near Bakersfield, has struck a stratum of oil sand. Near Bakersfield, the Cantua well, on 14, 28-27, is down 1073 feet. The Petroleum Center No. 3 is down 600 feet.

The Blue mine at Kernville, lately sold, will be reopened, after lying idle for seventeen years. Electricity will be used for light and power.

KINGS COUNTY.

The Kings County Oil Co., failing to find oil back of Hanford, has moved its Standard rig to the northwest quarter of section 16, 29-29, near there, and will start a 14-inch hole.

LOS ANGELES COUNTY.

The Union Jack Oil Co. is drilling a second well on Belmont street, Los Angeles. The Parker Oil Co. is deepening a well on Edgeware road and Omaha street. The Dry Lake Oil & M. Co., capital \$50,000, is incorporated at Los Angeles.

MONO COUNTY.

The electric plant of the Crystal Lake M. Co. at Lundy is running satisfactorily. The lower tunnel, now in 200 feet, is progressing rapidly. Ten stamps are dropping, and ten additional will be soon. The mill at the Bodie tunnel, near Bodie, is being put in shape for a run on ore from that mine.

NEVADA COUNTY.

The Tule Belle, at Grass Valley, is producing good grade ore.

At the Providence, near Nevada City, operations are going forward on the 1800-foot level.

PLACER COUNTY.

Electric power will be used at the Southern Cross (quartz), near Colfax; a dam is being built in the American river. The new tunnel at the Jupiter (gravel), on Iowa Hill, is in 260 feet; eleven men are employed.

RIVERSIDE COUNTY.

The Crystal Spring M. & M. Co., capital

\$3,500,000, is organized to work what was formerly known as the Midnight Owl at Kenworthy; J. L. Harman, of San Jacinto, Supt.; an 800-foot crosscut tunnel will be run to strike the ledge; \$50,000 are raised for development purposes.

SHASTA COUNTY.

The Trinity Copper Co. is the title of a Boston corporation floating the stock of a property 8 miles from Copley which gives promise of being of value, though the thing is enormously overcapitalized—\$6,000,000. It was formerly owned by Galvin & Filius and now includes the old Hearne property.

The foundry and machine shops of the Mountain Copper Co., at Keswick, will build a pump with a daily capacity of 1,000,000 gallons of water for use in increasing water supply at the smelters at that point. Work on the 9-mile branch to be built by the Trinity Copper Co. of Boston, to connect the King Copper and Shasta groups (copper) and smelter with the S. P. R. R., will probably be started early this year; the company has just bought the Pine Flat, Wash Boulder, Motion Creek and United Placer placer claims in Section 29, Township 33 north, Range 5 west, near Redding, comprising 430 acres.

SIERRA COUNTY.

The shaft at the Sierra mine, Downieville, is down 110 feet; sinking pump 45 feet will give a pressure of 465 feet and permit a further sinking of shaft to 175 feet.

SISKIYOU COUNTY.

Supt. G. Seward reports ore in the upper tunnel of the Square Deal, on Deadwood creek, near Yreka; a tunnel is being run to tap it, and, if ore continues good, a mill will be put in. The new mill at the Dewey, Gazelle district, is nearly completed; lower tunnel is being extended. Work on the Eastlick, Oro Fino district, is resumed, as late rains have filled the ditch system.

At the Willard, in Hamburg district, equipment is going in. The Hammer-Loan, same district, has resumed, water being sufficient to supply a 3½-inch nozzle. The Maplesden, on Nigger creek, Hamburg district, will resume.

In Scott Bar district the lower tunnel on the Russell has cut the ore; the mill is running steadily. The steam dredger at Hawkinsville is closed for the present.

New machinery will go in on the Hair Oil and Last Chance mines, at Calahans; the mines will be worked by a method devised by Pres. McFadden; a shaft will be sunk to bedrock and will be made water-tight by bands of sheet iron; water will be kept out and drifting will be begun from bottom of shaft; the company will probably build a dredger.

All claims on streams near Happy Camp are being worked. Drifting is in progress at the bottom of the shaft on the Greenhorn No. 2 (blue gravel).

TRINITY COUNTY.

The Sweepstakes claim, 4 miles southwest of Weaverville, is an ancient channel several miles in extent. Tests indicate 25 cents per cubic yard; the gold is coarse, black stained near bedrock; a hydraulic plant will be constructed; F. H. Hall is general manager, 108 Crocker building, San Francisco.

Gilzeau & Davis recently opened up an old channel of gravel on the right side of Canon creek, opposite Pennsylvania Bar.

C. W. Spratt & Co. have uncovered a 15-inch ledge on property adjoining the Chloride group on Canon creek.

C. D. Galvin is pushing work with his new dredger at Weaverville. It is said that the gravel deposits on the Last Chance will require more than 75 years to exhaust.

TUOLUMNE COUNTY.

At the Mt. Jefferson mine twenty stamps are now dropping; at 300 feet in depth the ore vein is 14 feet in width, 7 feet nearest the hanging wall and 7 feet on the foot-wall; the sulphurets average 7%, value \$40 per ton; chlorination works will be erected; J. M. Meighan is general mgr.

It is locally reported that the Street, at Tuttle-town, will be reopened. Supt. Long is pushing work on the Tri-Color; the drift on the 200-foot level is in 80 feet; a tunnel is being run from the mill towards the hoist; a rock crusher will be put in. J. Meighan is to take hold of the Accident, at Big Oak Flat, and develop it. On the Peciliana, east of Stevens Bar, Supt. S. E. Ball has men working the property. The Republican Co. has finished its tramway, and is conveying ore to the 10-stamp mill on the Mammoth. The shaft on the Clio is down 300 feet; three eight-hour shifts are working. Oil is being used as fuel at the Clio and Willetta mines.

Supt. Restano is pushing work at the Golden West at Sonora.

VENTURA COUNTY.

Work on the Home Oil Co.'s well, south

of Santa Paula, is progressing satisfactorily; well is down 500 feet.—The Tapo Oil Co. is drilling well No. 3.

YUBA COUNTY.

The Clark mine, at Brownsville, is to be reopened by New York and Boston men, represented by J. O. Stewart of Danville; the mine is bonded for three years; the incline will be retimbered and latter will be connected with mill by means of a hoist; the lower tunnel, now in 500 feet, will be continued to make connection with the old main shaft; the 10-stamp mill now on the property will be remodeled, four new concentrators and a canvas plant added; twenty-five men will be employed.

COLORADO.

The mineral output of Colorado for the year 1900 is estimated as follows:

Gold.....	\$35,183,457
Silver.....	15,445,398
Lead.....	7,317,810
Copper.....	2,341,379
Iron.....	5,684,620
Zinc.....	1,045,000
Coal.....	9,625,000
Oil.....	250,000

Total.....\$76,892,664

The output of coal in the State for 1900 was 5,470,734 tons, an increase of 643,795 tons over that of 1899.

CLEAR CREEK COUNTY.

The Peters tunnel, Idaho Springs, is to be operated under new ownership. A new gasoline engine is in. The tunnel is in 270 feet.—The De Lesseps, in Gilson gulch, will resume. A gasoline hoist will be put in the winze, which will be sunk in a good body of ore, and the adit will be driven ahead. Sinking of the Black Lion shaft is under way. The ore is high-grade silver.—It is said that parties are figuring on the erection of electric power plants at Idaho Springs to supply the mines and mills with that kind of power.

EL PASO COUNTY.

The Rio Grande sampler at Colorado Springs recently sent out sixty-seven carloads—or 1730 tons—of ore worth in the aggregate \$103,000.

HINSDALE COUNTY.

Work on the Tobacco group, on Cinnamon mountain, near Lake City, will be continued until spring, when operations on a large scale will begin.—At the Golden Fleece mill the Huntington mills are placed in new positions under large storage bins. New surface sizers are in; a new mill will go in soon. The canvas tables, which are placed below the concentrating tables, are effecting an additional saving of \$100 per day.—Thirty men are working at the Black Creek.

LAKE COUNTY.

The Maple Street shaft of the Maple Street M. Co. is on the California Gulch flat and is down 300 feet, with sinking still in progress.

The California Gulch shaft has reached a depth of 535 feet, which is about 80 feet lower down than the lowest workings in the Bon Air, which joins the former property on the north. The shaft is two-compartment, with good hoisting facilities. On the 400-foot level is a Jeaneville pump and a Knowles pump at the 530 station; also, a bucket and sinking pump at the bottom. At present 400 gallons of water per minute are being handled. The boilers aggregate 245 H. P., and the friction hoist is good for 1000 feet depth. In sinking the California Gulch shaft a 50-foot stratum of dolomite sand was passed through, which made the work difficult. From the bottom of the shaft drifts are being run in all directions prospecting for ore.

The Weldon, Nubian and Morocco mining companies are all under one management. The Weldon mine, which occupies a location just east of Bon Air, on Carbonate hill, is shipping fifty to seventy-five tons per day, and Manager Schlessenger states that this will be increased. The Weldon shaft house, which was destroyed by fire last August, has just been rebuilt and the work in the mine resumed. The normal output here is 150 tons per day. The Nubian group, on which are two shafts, joins the Weldon on the southeast and ships sixty tons per day. The Weldon and Nubian ores consist of lead carbonates and oxidized iron ores, making a good silver-lead product. The bulk of the tonnage comes from 560 to 600 feet depth, the same as in other mines on Lower Carbonate hill. The grounds of the Morocco Co. are in California gulch, just southwest of the Bon Air. On this property the A. V. shaft is being sunk as a prospecting project.

Leadville, Jan. 1.

On the Home group the Penrose shaft has been sunk from the 540 to the 600-foot level, and through the workings on the latter access is obtained to the present known ore body. From the bottom of

the shaft a main level, mostly in ore, has been run 400 feet northward. It is timbered up, electric lighted and provided with double tracks for ore cars. From this main level crosscuts are being run eastward and westward, cutting through and in some cases under the ore body. From these crosscuts upraises are being cut toward the open workings at the 540-foot level. There are five of these crosscuts penetrating the ore on the east side of the main level, and seven on the west side. By this it will be seen that a body of ore approximately 400 feet square, on a horizontal plane, is in a fair way to be blocked out in square sections. The ore body, thus encompassed, appears to be one of continuity, with the exception of here and there a roll of lime; present workings also indicate that it has a vertical extent of 40 or 50 feet, allowing for variations and irregularities in the formation. A similar stratum of ore has been stopped out on the 540 level to the extent of about 300 feet square. At present, all work is north of the shaft, but it will proceed into the Home ground southward at a later date. Near the bottom of the shaft a pumping station is being cut out, which will be 12x15x63 feet, where a duplex compound pump will be put in position before the first of the year. At present a pump of smaller capacity is handling the water, the volume of which is diminishing. About 225 tons per day of ore are being hoisted from the Penrose and 100 tons from the Bon Air and Star. In general, these ores are an oxidized iron and manganese, averaging about eight ounces silver, the allowance for excess of iron and manganese being sufficient to offset the treatment charges at the smelter. There are, however, frequent streaks of lead carbonates.

Leadville, Jan. 5.

The mineral output of the Leadville district for 1900 shows a gain of nearly \$4,000,000 over that of 1899, with a tonnage of over 820,000 tons of ore. The valuation of all metals produced is given as follows:

Gold.....	\$2,850,146
Silver.....	4,627,044
Lead.....	2,704,576
Copper.....	445,286
Spelter.....	1,867,742
Manganese.....	141,000
Bismuth.....	240,900

Total.....\$12,876,694

Twenty-five leasers are working the Gallagher at Leadville. From 700 to 1000 tons of ore are taken out monthly.—A. Boyd of Leadville is sinking a new shaft on the Fanchon, in Sugar Loaf district.—A new furnace will be in blast at the Boston smelter, Leadville, shortly.—A boiler and pump will go in at the Valentine No. 1 shaft.—Work on the shaft at the mouth of Iowa gulch will be resumed; W. A. Clark of Montana owner.—A shaft is going down at the Kubera.

LA PLATA COUNTY.

The drift on the Waterloo to intersect the Bluff is in 208 feet.

MINERAL COUNTY.

The Ridge at Creede is running again, the pumps having been put in good shape.—The new electric hoist for the Commodore shaft No. 5 is in and hoisting will soon begin. The shaft, now down 50 feet, will be sunk to the Nelson tunnel level.—The ore body in the South No. 10 drift in the United States has opened out again and ore is shipped. In the north drift the ore body is opened up for 300 feet of an average width of 10 feet.—The crosscut on the Reno at Sunnyside is within 40 feet of the shaft.

PARK COUNTY.

C. Gumaer is pushing work on the Never Sink, on Hoosier pass, near Alma.—The Good Samaritan, operated by the Orphan Boy Co., is shipping ten tons of ore per day.—Parker and others recently opened up \$45 ore in the old shaft of the Buckskin.

PITKIN COUNTY.

Two feet of lead ore are reported opened up in the Anaconda, on Porphyry mountain, near Aspen.

SAN JUAN COUNTY.

An auxiliary steam plant is going in at the Kendrick-Gelder smelter at Silverton.—E. Jones has run his crosscut tunnel on Hazleton mountain 200 feet. An additional 100 feet will cut the lead.—The Minnie Gulch Tunnel Co. is running a tunnel on 6 feet of ore. Seventy-five men are working.—A 60-foot tunnel will be run on the Old Time mine, Bear mountain. The ore is said to run \$50 to the ton.—A 75-foot shaft is sunk on the Mayflower, on Boulder mountain. The property may soon be sold.—Manager J. Woods states that the Marcella crosscut tunnel, on the lower end of Kendal mountain, is in 445 feet.—Four electric drills will go in on the Champion No. 2, on Sultan mountain, near Silverton, and a 700-

foot crosscut will be run.—Surprise No. 2, in Cascade basin, is producing ore running \$40 to the ton. A tunnel is being run.—On the Surprise at Eureka a 100-foot continuation of a 200-foot drift is being run. A 100-foot shaft is being sunk.—The crosscut tunnel on the Ivey, on Mineral creek, is in 145 feet. An additional 50 feet will have to be run to cut the lead.

SAN MIGUEL COUNTY.

There are 1800 feet of tunnels on the El Dorado group, in Roger basin, near San Bernardo. A tunnel to gain a depth of 1500 feet will be run in the spring.

SUMMIT COUNTY.

The mineral output of the county for 1900 is given as follows:

Placer gold.....	\$175,000
Gold from ores.....	325,000
Silver from ores.....	275,350
Lead.....	220,972
Copper.....	9,680

Total.....\$1,006,010

The machinery for the new cyanide plant for the Cashier, at Breckenridge, is on the ground.

TELLER COUNTY.

The production of gold ore mined in the Cripple Creek district during year 1900 amounts to a total of 504,668 tons, with a valuation of \$22,538,200. Itemized table follows:

Plant—	Tons.	Value.
Colorado-Philadelphia.....	102,180	\$4,015,674
Metallic.....	93,000	2,212,500
National.....	33,000	1,039,500
El Paso.....	37,100	1,025,500
Economic.....	31,488	854,928
Arequa (Colo.-Or.).....	25,000	750,000
Gillett.....	11,100	341,598
Brodie.....	5,000	107,000
Detroit.....	1,600	32,000
Atlas.....	1,200	39,500
Union (one month).....	4,000	120,000

Total.....344,668 \$10,538,200

Smelters.....160,000 12,000,000

Grand total.....504,668 \$22,538,200

Dividends paid in 1900 amounted to \$6,181,286.71; dividends paid to date, \$17,751,346.14.

The shaft house and office building, on what was formerly the Brady lease on the Burns, at Altman, were destroyed by fire on the 24th ult.; loss about \$1000; shaft house and gallow-frame will be immediately rebuilt.—Work is being done in ten shafts on the Hull City, Victor.—The Gilpin, Creede & Cripple Creek M. Co. is sinking a shaft on the west end of the Atlanta.—Drifting is in progress on the 625-foot level on the Orpha Belle vein.—Ore recently opened up on the middle block of the Pauper, east of Altman, assays \$11 to the ton.—On block No. 3 of the Deadwood, a shoot of ore was recently opened up, samples from which ran \$1000 to the ton.

The old Elkton machinery is in on the Hoosier shaft, and work is in progress below the 400-foot level of the latter.—A new plant is going in on the Bob Lee, adjoining the Hoosier.—The Little Edith, on Battle mountain, is putting in new machinery.—The Solitaire Co., operating the Columbia, is saving ore for shipment, and the capitalization of the company is increased to \$2,000,000; a hoisting plant will be put in immediately.—The shaft on the Hillside, Cripple Creek, is down 200 feet; good ore is being shipped.—Ore is opened up on the Vindicator at a depth of 880 feet; sinking will be continued to the 1000-foot level; a station will be cut at the 900-foot level.—The Bob Lee Co. has bought the old plant of machinery of the Alameda Co., at Gillett, and will put it on the Bob Lee, on Tenderfoot hill; the old 60-foot shaft will be continued to the 300-foot level.—The old plant of machinery, formerly used by the Margery Company on the May-Be-So, on Globe hill, is sold to the Federal G. M. Co., who will put it on the Colorado City, on Bull hill.

The working shaft on the Mayflower, north of Tenderfoot hill, Victor, now down 50 feet, will be sunk to the 300-foot level.—The ore shoot recently opened up on the 263-foot level of the Red Umbrella, on Raven hill, is now 2 feet wide; ore averages 2 ounces gold to the ton; drifting will be continued for 300 feet.

On the 24th ult., the Doctor-Jack Pot consolidation shipped two cars of \$50-ore, and one car of 10-ounce ore; connection between the Doctor and Morning Glory shafts is expected to be made within 60 days.—The miners of the Portland, in addition to the wages for Christmas day, were each presented with \$5 by President J. Burns.—Two feet of high-grade ore are opened up at a depth of 90 feet on the Stacy & Stafford lease on the north end of the Zenobia.

IDAHO.

The production of metals in Idaho during the year 1900 amounted to \$14,150,000,

an increase of \$586,582 over 1899. The gold production, according to present estimates, fell off \$500,000, while that of other metals increased. The figures for year are as follows:

Gold.....	\$2,000,000
Silver.....	6,000,000
Lead.....	6,000,000
Copper.....	150,000

Total.....\$14,150,000

ADA COUNTY.

J. W. Cunningham, in charge of the United States Assay Office, at Boise, furnishes following statement of gold bullion bought during eleven months ended November 30, 1900:

January.....	\$120,139 74
February.....	47,717 34
March.....	106,182 09
April.....	101,931 20
May.....	188,590 20
June.....	202,044 73
July.....	196,704 21
August.....	171,789 04
September.....	145,584 86
October.....	156,371 15
November.....	133,581 88

Total.....\$1,570,636.49

Owing to a scarcity of coal, several of the mines near Boise are closed down.

BLAINE COUNTY.

To Dec. 1, 1900, there were shipped from Wood River 2561 tons of ore worth \$200,000.—The Cressus (gold) at Wood River is temporarily closed down; it is said that a new mill will go in this spring.—Manager Lusk is pushing work on the Tip Top.—At Bradford, new machinery is in on the Minnie Moore.

BOISE COUNTY.

The new mill on the I. X. L., at Pearl, is giving satisfaction.—At the Checkmate the 300-foot level is being opened up, fifty tons of ore being taken out daily.

The Cripple Creek & Idaho Exploration Co. will work the South African (quartz), on Elk creek, Idaho City.—The 6x8-foot shaft on the Golconda is down 35 feet. A hoist and pump will be put in.—R. Z. Norcross is running a tunnel from Squaw creek towards the old Liberty.—Linsteadt & Ottenbacher are running a 200-foot tunnel on the American Girl (quartz), on More creek, 8 miles from Idaho City. An additional 300 feet will probably be run next spring.—Garrecht & Orchard are working the Iroquois, in Shaw's gulch, 3 miles southwest of Idaho City.—W. A. Magee is sinking a shaft on his claims on Shaw mountain, near Idaho City.

CUSTER COUNTY.

A strike of rich ore is reported made in the tunnel on property near Houston.—J. E. Leger of New Jersey and others, operating the Blue Wing, Lost Horse and other claims near Custer, will probably put in a new mill soon.

IDAHO COUNTY.

The Evergreen, Eureka and McArthur claims at Camp Dewey are reported bonded to Salt Lake men for \$125,000. A mill will go in.

Work on the Alamance, at Elk City, will be resumed; Manager Bradford is putting in a new 45,000-gallon per hour pump, and other machinery.—Finch & Campbell are having a survey of the Ajax group made for a U. S. patent on same; a 240-foot shaft is sunk on the property, and free milling ore is being piled on the dump awaiting the erection of a mill which will probably be put in next spring.—D. Trullinger is reported to have made a strike on the Columbia No. 2 (quartz), of the Columbia group, near Bear Creek, in Dixie district.—The tunnel on the Helen Gould group is in 200 feet, and the shaft is down 80 feet.—On the Hill Top, the tunnel is in 150 feet.

OWYHEE COUNTY.

On Dec. 24th, 1900, the tunnel on the War Eagle, at De Lamar, had reached the 2840-foot mark.

New machinery will go in on the mines at South mountain next spring.

SHOSHONE COUNTY.

During 1900 the mines in the Ceur d'Alene region have produced 1,600,000 tons of crude ore, and they have shipped 180,000 tons of concentrates, the estimated product from which is put at from 90,000 to 100,000 tons of pig lead; the gross value of the output is given at \$14,000,000; average value of ore shipped is 25% lead and thirty ounces silver to the ton. Since 1886 the region has produced \$100,000,000 worth of silver.

The Bitter Root Mountain M. Co., recently organized, has bought a group of claims, including the United States, America, Virginia, Pittsburg, Tom Boy and Don't Know, on Placer creek.—The Orofino M. Co., operating mines near Pierce, has moved its main office from Spokane, Wash., to Walla Walla, Wash. The company may buy more claims at

Pierce.—The main tunnel in the Ray, in Beaver Creek district, near Delta, is being driven.—Harbin & Tilling are driving a tunnel in the Beaver. It is in 100 feet and it is expected to strike galena at 300 feet.

The Empire State-Idaho M. Co. is pushing work on its new concentrator at Government, near Wardner, to completion.—The Star M. Co. will soon begin driving a 2000-foot tunnel on its group near Mullan.

WASHINGTON COUNTY.

The new smelter at Mineral is in operation; about sixty men are employed in the mines.

MONTANA.

E. D. Braden, late assayer in charge of U. S. Assay Office at Helena, estimates total gold production of the State for 1900 at 246,000 fine ounces, worth \$5,126,160, and the silver production at 16,750,000 fine ounces, having a coinage value of \$21,607,500.

The actual production of the metals during 1899, according to the report of Mr. Braden to the Director of the Mint, was: Gold, 233,127 fine ounces, worth \$4,819,156; silver, 16,850,755 fine ounces, worth, at coinage value, \$21,786,834.

MEAGHER COUNTY.

A 200-foot crosscut tunnel is being run on the Silver Belt, at Neihart; a bucket tramway will be put in when tunnel is completed; \$50,000 has been spent in development on this property.—The addition to the Diamond R. concentrator is nearly completed; machinery will go in soon; the tramway to the Broadwater is under way.

SILVER BOW COUNTY.

A company is being organized in Butte to work the Emma, near there; it has bonded the mine for \$110,000; sinking will soon begin and shaft will be sunk to 800-foot level; property is equipped with a steam hoist capable of sinking to a depth of 1000 feet.—F. A. Heinze has bought the Little Ida, on Horse canyon, near Columbia Gardens.—On Dec. 30, T. McLaughlin, receiver for the Nipper, filed his November report; it shows receipts as \$21,563.65 and expenses as \$21,989.09, leaving a debit balance of \$425.44.

NEVADA.

The estimated yield of the mines of Nevada for 1900 is \$3,500,000.

ELKO COUNTY.

During 1900 the mines of the county produced \$255,000.

ESMERALDA COUNTY.

It is estimated that there is \$10,000 worth of ore in sight at the Wilson at Pine Grove.—In Tonopah leasers are restricted to 200 linear feet on the vein, and they pay a royalty of 25%.

EUREKA COUNTY.

The output of the county mines for the year 1900 is given as \$336,000.

The Ruby Hill Tunnel & M. Co., at Eureka, levied an assessment of one cent per share, delinquent on the 28th inst.

During the week ending Dec. 28, 1900, the following shipments of ore were made from the mines at Eureka:

	Pounds.
Bullwhacker.....	66,740
Eureka Con.....	147,870
Helen.....	3,970
Silver Connor.....	10,220
	228,800

LINCOLN COUNTY.

The mines of the county produced over \$1,000,000 worth of ore during 1900.

LYON COUNTY.

A strike of ore running \$100 to the ton is reported made near Como.

STOREY COUNTY.

The production of the mines of the county for 1900 is given as \$251,000.

WHITE PINE COUNTY.

There are about 100 men working on the Robust, Chairman and Pilot Knob mines, near Ely.

NEW MEXICO.

COLFAX COUNTY.

At the trustee's sale of the Golden Ajax, recently held in Raton, the property was bought by C. C. Forrester for \$14,000 for the creditors.

DONA ANA COUNTY.

The pumping machinery at the Torpedo, at Organ, is working satisfactorily; shipments of ore will be started soon.—Work on the Memphis is suspended until June 1st.—Allen & Keen of Cripple Creek, Colo., are working three claims near Organ, and they expect to begin shipping ore next month.—More men will probably be put on at the Excelsior.—The Copper Bar M. & M. Co. has stopped operations for the present, owing to inflow of water; larger pumps will be put in and operations resumed.—The 100-ton con-

centrator of the New Mexican Lead Co., in San Andreas canyon, at Organ, is nearly completed.

OREGON.

The gold production of Oregon for the year 1900 is estimated to amount to \$3,770,000.

BAKER COUNTY.

M. F. Bennett, owner of the Tempest, in the Greenhorns, near Sumpter, reports a strike of \$26 ore on the property; the tunnel is in 150 feet; Mr. Bennett contemplates the erection of a smelter on the property next year.—The drift from end of the 450-foot crosscut tunnel on the Cayuse, in the Greenhorns, is in 60 feet; drifting will be continued through the winter under Supt. E. Hahn.—The Mammoth mill, near Sumpter, is running again; plant consists of a 5-foot Bryan mill, four 6-foot concentrators, crusher and a 25 H. P. engine; the mill will run on ore from the Belle Baker.—The Scandia Tunnel Co., running a tunnel through Quebec mountain, reports good progress being made; Manager C. R. Aldrin states that he is preparing to put in power drills and a compressor plant.—The new mill on the Richmond, of the Empire M. Co., is completed.—The tunnel on the Keystone Belle and Gold Bay consolidated claims, in the Bonanza district, is in 700 feet; manager, J. W. Boland.—Supt. Williams has eighteen men working on the Little Giant; the crosscut, now in 1000 feet, is expected to cut the lead at 1020 feet; a 20-stamp mill, vanners and a complete electric light plant are on the ground, but they will not be put up until nature of ore in main ledge is determined by the new tunnel.

The crosscut tunnel on the Connor creek, at Baker City, has reached the vein; the tunnel is over 3000 feet long, and it cuts the ledge 1000 feet below the surface; two shifts are working; the mill has thirty-five 750-pound stamps, and is run by water power.—The Huntington M. Co. will work the Connor creek canyon placers next season.—The tunnel on the Gordon property, at Sumpter, is in 200 feet; ore is said to assay \$8 to the ton.

There are 400 stamps at Baker City, distributed as follows: Bonanza 40, Columbia 20, Golconda 20, Connor Creek 35, Union Companion 20, Gold Ridge 10, Robbins-Elkhorn 10, Little Giant 20, Mag-nolia 10, Mammoth 10, Hines & Helmer 10, Empire 10, Red Boy 20, North Pole 20, Badger 20, Gold Hill 10, Baisley-Elkhorn 20, Flagstaff 10, Ohio 10, May Queen 10, Cougar (100-ton cyanide plant) 30, Bald Mountain 20, Starr & Starter 5, Brazos 10. Additional stamps are going in as follows: Gold Hill 10, Empire 10, Brazos 10, Mammoth 10, Bald Mountain 10, Golconda 10, Columbia 10; total 70.

The controlling interest in the Bison G. M. & M. Co., of Sumpter, is sold to San Francisco men; work on the Bison group, at Quartzburg, will soon begin.—Six giants are operating on the Rye Valley placers, on Dixie creek; each giant produces from \$20 to \$25 per day.—Supt. Copsey is pushing work on the Crown Point, in Cable Cove camp; steam drills are used; the 500-foot crosscut tunnel is in 200 feet; altitude of the Crown Point is 7970 feet.—The main working tunnel on the Gipsy Queen, in Cable Cove camp, has reached a depth of 70 feet.—The Burnt River G. M. & M. Co., operating near Express, has a 10-stamp mill equipped with 1000-pound stamps, ore crusher, four concentrators, etc., with a crushing capacity of thirty tons of ore per day.—The Keystone mines in the Virtue district will probably be put in shape to run by spring.

JACKSON COUNTY.

A new mill is going up at Gold Hill.—Five additional stamps are going in at the Oregon & Montreal M. Co.'s mill at Ashland.

The 10-stamp mill at the Braden, at Jacksonville, is running steadily.

JOSEPHINE COUNTY.

Two veins of ore—one high grade and the other low grade—are reported opened up on the Greenback, in Grave creek district.—The Gold Standard M. Co., capital \$4000, is incorporated at Grant's Pass.

UNION COUNTY.

The old Gem, near Sparta, is reported bonded to Denver men, who will work it on a large scale.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The American M. Co. will resume boring with the diamond drill in Spearfish canyon, near Deadwood. Drifting continues from the bottom of the shaft. The face is 300 feet from the shaft; I. Madill Supt.—S. R. Thompson of Boulder, Colo., is reported to have bought property near Galena, 10 miles east of Deadwood.

The Holy Terror-Keystone Co. is doing development in the Holy Terror mine. Headers are being driven on the 800 and

900-foot levels. Fifteen stamps of the Keystone mine are dropping.

PENNINGTON COUNTY.

A strike of rich ore is reported made on the 185-foot level of the Chilcoot, 8 miles from Keystone.—The Wealthy group, near Keystone, is sold to a Sioux Falls company. A 20-stamp mill and a 100-foot two-compartment shaft are on the property. G. P. Ward represents the buyers.

UTAH.

The mineral output for the State during the year 1900 is given as follows:

	Ounces.	Value.
Gold.....	206,261	\$4,263,414 87
Silver.....	10,196,818	6,322,027 16
	Pounds.	
Lead.....	96,088,100	3,843,524 00
Copper.....	18,354,726	2,973,465 61

Total valuation.....\$17,402,431 64

[Gold computed at \$20.67 per ounce; silver, 62 cents an ounce; lead, \$4 per hundred; copper, 16½ cents per pound.]

The following table shows number of pounds ore and bullion from mines of Utah handled by railroads for the years 1899 and 1900:

	1900.	1899.
	Pounds.	Pounds.
Silver-lead ores.....	206,195,902	89,925,227
Silver-lead bullion.....	46,159,052	50,017,257
Copper bullion.....	12,302,407	7,812,875
Copper ores.....	4,963,940	30,000
Iron ores.....	140,000	
Sulphides.....	60,000	

Total.....269,821,301 147,785,359
Increase for 1900, 122,035,942 pounds, or 87.57%.

During 1900 the mines of Utah paid \$3,060,400 in dividends, as follows:

	Paid in 1900.
Centennial-Eureka.....	\$317,500
Con. Mercur.....	110,000
Carissa.....	35,000
Daly-West.....	487,500
Dixie.....	15,000
Gemini.....	125,000
Golden Gate.....	420,000
Grand Central.....	25,000
Grand Gulch.....	2,400
Horn Silver.....	20,000
Mammoth.....	220,000
Mercur.....	115,000
Ontario.....	90,000
Rocco-Homestake.....	4,500
Silver King.....	1,000,000
Silver Shield.....	1,500
Swansea.....	70,000
Utah.....	2,000
Total.....	\$3,060,400

Total amount of dividends paid by mines of Utah to date is \$38,642,750.—The coal production of Utah mines for 1900 is shown in following table:

	Tons.
Pleasant Valley Co.....	984,399
Weber Coal Co.....	42,644
Grass Creek Co.....	32,360
Sanpete county.....	7,500
Uintah county.....	6,500
Emery county.....	8,000
Grand county.....	1,000
Other small mines.....	52,500
Total.....	1,134,903

Of this amount 550,000 tons were exported, the balance being consumed in the State.

BEAVER COUNTY.

Good reports are made regarding the Ben Harrison group, at Frisco.

IRON COUNTY.

The shaft on the Hope group, near Modena, is down 60 feet; a ledge of spar and quartzite 15 feet wide is opened up on this level.—Nolf, McNeill & Dye expect to develop the Old Mack group, on which they recently found a 6-foot ledge of ore, assaying \$7 in gold and silver to the ton.

JUAB COUNTY.

A 2-foot vein of lead ore is reported opened up in the drift 100 feet below the tunnel level on the Tiernan, at North Tintic.—A new body of high-grade ore was recently opened up in the upraise from the 525-foot level of the Shoebridge-Bonanza; ore is being taken out for shipment.

The Tesora of Tintic is to have a concentrator; plans are in preparation and contract for construction will be let soon.—The workings on the Swansea are now 1050 feet deep; crosscutting is in progress on this level.

SALT LAKE COUNTY.

The Mingo smelter, at Sandy, belonging to the American Smelt. & Ref. Co., is closed down; the company is putting up a new 1000-ton a day plant, but this is not expected to be completed until August next.

G. B. Sessions reports favorable progress at the Silver Shield, at Bingham; semi-monthly shipments of ore are being

made.—At the second annual meeting of the Boston Con. C. & G. M. Co., Ltd., held in London on Dec. 20th, report submitted showed that amount expended upon development of property, which included office and general expenses for year ending Sept. 30th, less amount realized from ore sales, was \$48,636. On the company's territory at Bingham during year 2811 feet of tunnels, drifts and crosscuts have been completed. Management states that better results have been obtained from tests made by company's milling department than those obtained by Mr. Edison and others. The erection of a concentrating mill has been postponed.

During the month of December the Highland Boy smelter, at Bingham, turned out 480,000 pounds of copper, gold and silver bullion.

During 1900 the Taylor & Brunton sampler at Salt Lake treated 113,867 tons of ore; the Conklin sampler during the same period treated 53,000 tons of ore; the Pioneer sampler, at Sandy, treated 24,912 tons of ore during the year.

The furnaces of the new Highland Boy smelter, at Bingham, are blown in; all construction work will be finished in two weeks.—The Irish-American is reported bonded to Baltimore men for \$50,000; work will be pushed on the property.

The Shawmut Co. at Bingham has contracted with the Telluride Electric Co. for mill power, which is expected to be in by Feb. 1; fifteen men are working on the Shawmut.—The Standish & Jimpson Co. will soon begin hauling ore from the Northern Light to the Dewey mill.—Development is progressing on the Congor, at Bingham; a mill will probably go in next year.—Eleven men, besides several leasers, are working on the Columbia, Bingham; good ore is being taken out.

Work on the Golconda, Salt Lake, will be continued through the winter.—Operations on the Anthony group, at Bingham, will probably resume soon.—Tram connection with No. 7 tunnel at the Highland Boy is made.

A well-defined vein of galena is opened up in upper workings of the York, at Bingham, 200 feet below the surface.

SUMMIT COUNTY.

Sinking is in progress on the Alliance, at Park City; manager, T. Kearns.—J. Rhoden has men working on the Rhine Fraction and Manadock claims of the Crown Point Co., near the Ontario.

The earnings of the Ontario, at Park City, for the year 1900 are given at \$662,000.

TOOELE COUNTY.

The West Argent M. Co. of Stockton has levied an assessment of 2 cents per share, delinquent Jan. 23, to clean up indebtedness incurred in the erection of the new concentrator, recently completed; the mill is running; more men are being put on.

About 800 tons of ore are daily being run through the mill at the Con. Mercur, at Mercur.

UTAH COUNTY.

The Giant group, in Dry canyon, Deep Creek district, consisting of four claims, will be worked by W. Babcock and others.

WASHINGTON.

FERRY COUNTY.

The east drift in the Flag Hill is in about 50 feet; values have increased from \$10 to \$46.45 per ton; a working shaft will probably be sunk to the 200-foot level.

Work on the Trilby, on the San Poil river, 5 miles south of Republic, is resumed; ore from this mine runs about \$7 or \$8 to the ton.—Supt. E. J. Delbridge, of the California, states that the shaft is down 140 feet; good ore is being taken out; a whim is used for hoisting.—On the Admiral Dewey a crosscut will be run on the 50-foot level.—The drift on the Hercules shows a good body of high-grade ore; average width, 7 feet.—Good progress is reported in driving the crosscut on the Oversight.

The Republic mill, at Republic, D. C. Jackling, manager, will make monthly cleanups.

Twenty-seven tanks, or 2700 tons, have been cleaned up at the Republic mill, at Republic; the following percentages of savings were obtained from last three tanks cleaned up: 90, 95, 50, 90, which are respectively the highest and lowest savings made to date.

The shaft on the Gray Eagle, now down 100 feet, will be sunk an additional 200 feet before crosscutting is started.—A 500-foot tunnel is run on the Copper Bullion; a winze is being sunk from the floor of the tunnel.—A 70-foot shaft is sunk on the Decimal.

LINCOLN COUNTY.

New machine rock drills are going in on property, near Egypt.

OKANOGAN COUNTY.

Sinking is in progress on the Six Eagles, at Loomis; a 50-ton concentrator will be

put in; concentrates run \$150 per ton.—Active work is in progress on the Puritan mines, on Gold Hill; 50 men are working; the company will put in a 50-ton mill.—The Golden Zone is enlarging its capacity from 25 to 75 tons daily.—It is reported that the Utica-Oro Fino will put in a big mill next spring.

SNOHOMISH COUNTY.

The new 3-drill air compressor is in place on the Ethel, near Index; twenty men are working at the mine; the new mill will go in soon, machinery for same being en route; work will be continued through the winter.

STEVENS COUNTY.

The capacity of the Northport smelter is being increased to 1200 tons daily.

Operations on the Copper King, at Chewelah, will resume.—A new 500-foot tunnel will be run on the Wells-Fargo, in Springdale district.—At the Eagle, Chewelah, a new double steam hoist will soon be in place, machinery being on the ground.—The Monarch M. & R. Co. has begun work on the North Star group, near Bossburg.—Trimble Bros. are working on the Pomeroy, on Sulphide mountain.

WYOMING.

BATTLE LAKE COUNTY.

The Beulah Copper Co. of Boston, Mass., capital \$1,000,000, has bonded three copper claims located by J. F. Ledbetter near Grand Encampment.

FOREIGN.

BRITISH COLUMBIA.

The Van Anda group, consisting of twenty-five claims on Texada island, is sold to an English company, \$450,000 being paid for 85% of the stock. The transfer will take place in February.—The Slocan Star at Slocan is producing good ore. Fourteen carloads recently shipped returned \$1600 to the ton.—On the 800-foot level of the Le Roi, Rossland, the crosscut to the south is in 200 feet. Good ore is opened up on the 1000-foot level of the War Eagle.

Shipments of ore from the Arlington Basin district during 1900 amounted to 2500 tons.—The main drift on the Bondholder is in 180 feet.

All machinery for the new plant at the Silver King, on Toad mountain, 8 miles from Nelson, is on the ground. Development work will be started on the 900-foot level in about three weeks; the mine is unwatered.—On Observation mountain, near Grand Forks, development work is going forward; a shaft is being sunk and a tunnel run.

The December output of the Sullivan group, East Kootenay, is given at about 1340 tons; a new tunnel to open up No. 3 level will be run; a railway spur from Kimberley to the mines will be built this spring.

ONTARIO.

The annual report of the Bureau of Mines gives the output of the Province for 1899 at \$423,978, as against \$36,900 in 1892.

Since restarting of the mill at the Mikado, Lake of the Woods district, 1365 tons of ore have been crushed, yielding 256 ounces gold; 1261 tons of tailings treated by cyanide process yielded 318 ounces of bullion; a new incline shaft is being sunk.

THE KLONDIKE.

It is estimated that in 1900 the N. W. Territory (Klondike) district, produced \$22,287,566 in gold and silver.

Recently Declared Mining Dividends.

Payable.

Mary McKinney M. Co., Colorado,	3 cents per share, \$30,000.....	Dec. 24
Empire State-Idaho M. Co., Idaho,	3% on capital stock, \$30,000.....	Dec. 31
Julian M. Co., Alaska, 5%, \$5000.....		Jan. 1

Catalogues Received.

"Electrical Wires and Cables for Telegraph, Telephone, Light and Power Circuits" is the title of a booklet on electrical conductors, with tables, price lists, and rules for safe handling, issued by the American Steel & Wire Co. Copies can be had upon application to any of its sales offices.

Personal.

S. B. MILNER, of Salt Lake, Utah, is in California.

W. F. SNYDER, of Salt Lake, Utah, has gone to New York.

DWIGHT B. HUNTLEY, of De Lamar, Idaho, is in San Francisco.

SUPT. HAZLETON, of the Mingo smelter, Sandy, Utah, is in Pennsylvania.

C. M. FASSETT returns to California from Korea on the next Japan steamer.

J. F. KIDDER, Cal. State Debris Commissioner, has resigned his official position.

GEO. WENDELING is elected Manager Kern River, Cal., Oil Producers' Association.

R. C. CHAMBERS, Supt. Ontario and Daly mines, Park City, Utah, has returned there from California.

A. B. RICHMOND, chief engineer Las Prietas mines, Sonora, Mexico, has resigned and will go to Socorro, N. M.

B. H. TATEM succeeded E. D. Braden as assayer in charge of the U. S. Assay Office, Helena, Mont., on the 1st inst.

A. E. ELLIOTT, of Gloucester, and A. P. Ayling, of Boston, Mass., both of the New England Cop. Co., are in Clifton, Ariz.

L. A. PHILLIPPS, of Pittsburg, Pa., is the new superintendent of the Trade Dollar power plant, at Swan Falls, Idaho, vice W. White.

W. C. KNIGHT AND A. C. LAWSON have been elected president and secretary, respectively, of the Cordilleran section of the Geological Society of America.

PHILIP ARGALL has completed a six years' engagement as manager of the Metallic Extraction Co., of Cyanide, Colorado, and has resumed the practice of consulting engineer at Denver, Colo.

E. G. STOBER will have general management of the Silver Lake group of mines at Silverton, Colo., which he is credited with having recently sold to the American Smelting & Refining Co. for \$2,500,000.

W. B. GILLINGHAM has returned to San Francisco from the Siberian coast, where he is manager for a Russian mining company, operating the only gold quartz mine in Siberia on the island of Askani, 30 miles from Vladivostok. Mr. Gillingham will return March 1, 1901, with additional stamps and machinery.

WILLIAM A. CLARK of Montana says: "I am going ahead with the new road from Salt Lake to Los Angeles. It will cost \$17,000,000, and the financial arrangements are all made. Complete surveys to Salt Lake have been made, and we shall begin laying rails from Los Angeles to San Bernardino soon. My contract for the sale of copper through the Lewisohns expires Jan. 31st, and after that I shall use most of it in my own wire works in New Jersey, where we are turning out 3,000,000 pounds of copper wire and rods per month."

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HYDROCARBON BURNER.—No. 664,022. Dec. 18, 1900. G. H. Larkin, San Francisco, Cal. This invention relates to burners for hydrocarbon oils and like material. The object is to discharge the jet of oil mingled with air or steam and to prevent the liquid from dropping into the lower part of the tube, so that it will not be properly vaporized. It consists of peculiarly curved wires held centrally within the burner tube or casing and extending into the discharge passage, peripheral wire extensions upon the interior of the discharge tube, an oil inlet feeding centrally into the burner and upon the first-named wires, and means for regulating the oil supply and the blast. The outer ends of the wires are curved and converged towards the center, and the oil traveling along these wires is continually brought in toward the center, the wires acting as ducts to lead it back so that the blast will vaporize and drive it into the furnace in proper condition for combustion.

QUARTER FOR LOW SHOES.—No. 33,806. Dec. 25, 1900. W. W. Glanville, San Francisco, Cal. The leading or material feature of this invention consists of two sides which constitute the quarter formed in a single piece, having the lower edges made approximately straight. A central V-shaped notch extends upwardly a short distance from the adjacent ends of the straight portions, and the upper edge of the quarter is approximately straight for the greater portion of its length, thence curving upwardly to-

ward each end. From its ends the upper edges curve downwardly and outwardly and meet the outer ends of the straight edges in an essentially reverse curve. The design is especially applicable to low shoes of the class known as "Oxfords."

BUTTER BOX.—No. 664,549. Dec. 25, 1900. J. K. C. Hobbs, San Francisco, Cal. This invention relates to an improved construction of boxes which are especially designed for the transportation of butter. It consists of a box, a cover therefor having a rim around its periphery and projecting downwardly, said rim and the upper edge of the box being formed with a rib-and-groove joint. Hinge plates are secured to the top of the cover and are bent downwardly over said rim and other hinge plates on the box are loosely connected with the first named plates in the plane of the outer sides of the box. Said box has a longitudinal groove in its front and a vertical groove or slot leads therefrom. The cover has a strap depending from its front edge and bent inwardly and adapted to enter the slot so that its bent end rests upon the bottom of the longitudinal groove. A bolt is slidable in the latter groove and is adapted to engage said bent end and lock the cover, and there is a means for retaining the bolt in its groove.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR THE WEEK ENDING DEC. 25, 1900.

Commercial Paragraphs.

THE Braeburn Steel Co. of Braeburn, Pa., are represented in Denver, Colo., by J. W. Copeland.

The Western Chemical Co., Denver, Colo., within the year 1900, made an increase of one-third in the capacity of their works.

GEO. E. TRUAX has sold the business of the Truax Mfg. Co. of San Francisco to the Globe Iron Works, Stockton, Cal., who will in future manufacture the cars.

In the eighth circuit, U. S. Circuit Court of Appeals, in the case of The Metallic Extraction Co., appellant, vs. Horace F. Brown, appellee, the decision of the court in full is received, affirming the judgment of the Circuit Court of the U. S. for the district of Colorado.

The Atlas Pipe Wrench Co., Flood Building, San Francisco, and 121 Liberty street, New York, report that the Atlas pipe wrench is now in use by both the American and British navies. The makers refer to this "as being another proof that merit tells, as the Atlas tool was practically unknown a year ago."

THE Byron Jackson Machine Works will occupy the premises No. 411 Market street, San Francisco, Cal., this month, as down town offices and salesroom for the works at the corner of Sixth and Bluxome streets. A complete line of steam and gas engines, boilers, centrifugal pumps, geared displacement pumps, etc., will be carried. They will also be prepared to install hydraulic plants per specifications.

Latest Market Reports.

SAN FRANCISCO, Jan. 3, 1901.

SILVER.—Per oz., Troy: London, 29½d (standard ounce, 925 fine); New York, bar silver, 64c (1000 fine); San Francisco, 64c; Mexican dollars, 50½c.

The quarterly estimate of the value of foreign coins made by the director of the Mint shows that the value of silver has increased during the last three months .24%. This increase is accounted for by the abnormal demand for Mexican silver in China.

The heavy exportation of silver from Mexico has caused great alarm. Silver has been going through El Paso to China and Japan at the rate of \$50,000 a day for five months and the country has been practically drained of silver. The banks have petitioned the Federal Government to stop the movement. The Government may place an export duty on silver. The banks have plenty of money, but it is all in gold not available except as collateral.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25 cash; carload lots, 17.00; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.62½; Casting, 1 to 3 casks, 16.75; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22½c.

New York exports of copper for December were 10,771 tons, making a total for the year 1900 of 151,988 tons.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.20; Missouri lead, \$4.32½ desilverized lead; San Francisco \$5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6½, sheet 7½, bar 6c; pig, \$4.70 @5.10. London, £16 5s per ton.

SPELTER.—New York, \$4.20; St. Louis, \$3.95; San Francisco, ton lots, 5c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13½c; 100-lb lots, 15½c.

IRON.—Pittsburg, Bessemer pig, \$13.50; gray forge, \$13.75; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$19.75; open hearth billets, \$21.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$27.00; San Francisco, ton lots, 29c; 1000 lbs., 29½c; 500 lbs., 29½c; less, 30c; bar tin, 30c.

QUICKSILVER.—New York, \$51.00; large lots: London, £9 2s 6d; San Francisco, local, \$48.00 ½ fask of 76½ lbs.; Export, \$45.

For the first eleven months of 1900 Great Britain imported 895,488 pounds and exported 1,825,982 pounds. The corresponding figures for 1899 were 3,877,184 and 2,187,402. Report of California quicksilver exports will be found on page 8.

NICKEL.—New York, 50¢@60¢ ½ lb.

MAGNESIUM.—New York, \$3.00 ½ lb.; San Francisco, \$4.00.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 15½c.

ASSAY LITHARGE.—San Francisco, 10c ½ lb, small lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

FERRO-MANGANESE.—Pittsburg, 80% domestic, \$85, large lots.

PHOSPHORUS.—F. o. b. New York 50¢@60¢ ½ lb.

TUNGSTEN.—New York, ½ lb., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37½, 35c; San Francisco, 65c (60%).

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%; carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c ½ lb set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@33½c ½ lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66½ B, 2c ½ lb.; soda ash, \$1.60 ½ lb. 100 lbs. 58%; hyposulphite of soda, 2½@3c ½ lb.; blue vitriol, 5½@6c ½ lb.; borax, concentrated, 7@8c ½ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1½@2c; nitric acid, in carboys, 8c ½ lb.; caustic soda, in drums, 3@4c ½ lb.; Cal. s. soda, bbls., 1c, spot, 85c, 95c ½ lb.; chloride of lime, \$1.00, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

For Prospecting Purposes
or Underground Work,

USING COMPRESSED AIR.

HOIST FOR PROSPECTING.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

GATES IRON WORKS.

Sole Manufacturers of the

Clark Patent Tube Mill.

The simplest and most durable machine for very fine grinding of ores either wet or dry.

Catalogue No. 15 describes it.

—Address—

650 Elston Ave., Chicago.

U

The Drip-Cock

is an exclusive feature with our Injector. It prevents freezing, starts with lower steam, enables you to draw hot water when Injector is working, and gives many other points of advantage to the

U. S. AUTOMATIC INJECTORS

over all others. Our little "Engineers' Red Book" covers 500 points of interest to every engineer and tells all about our Injectors. Write for one.

AMERICAN INJECTOR CO.,

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

DRY PLACER MACHINES.

THE PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 30 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries. SEND FOR DESCRIPTIVE CIRCULAR.

THE BEST TIME TO ADVERTISE

In the Mining and Scientific Press
is When You Want More Business.

CROWN GOLD MILLING CO.

To MINERS and MILLMEN.

If your ores are refractory; if you are losing concentratable values in your tailings; if your mines are in an arid district, or so situated as to make the introduction of water ruinously expensive; if you have large bodies of concentratable ores which could not be profitably treated hitherto,

THEN READ WHAT FOLLOWS:

The CROWN GOLD MILLING COMPANY'S concentrating machinery will concentrate any ores, sands or earths carrying metallic particles or metallic combinations of concentratable dimensions.

A shipping product of unexcelled purity is given, the greatest amount of concentratable values extracted, and a greater tonnage of ore is put into a ton of concentrates than by any other system of mechanical treatment. Every pound of ore delivered to machines is accounted for in the ore and concentrate bins.

It will cost you nothing to investigate, and may mean an increased profit on your ores, or a profit on bodies of ores which heretofore have failed to pay more than cost of treatment; or you may be enabled to make a productive property of a mine now idle.

We have a twenty-ton capacity plant in operation. All are invited to call and test it: from 1000 to 2000 pounds ore will be treated as a test. Charge \$20, to cover cost assays. Results at mine guaranteed to equal results obtained in testing. Wear and tear and labor cost guaranteed not to exceed cost by wet treatment of same character of ores.

Our machines are not for sale: they are placed on lease or royalty charge as may be agreed upon, and if results are not obtained as guaranteed no one loses but ourselves. Practice is better than theory: direct evidence is better than hearsay. All we ask of you is to come and be convinced that we have claimed less than we accomplish.

Time, Labor and Money Saved for Assayers.

Pat. applied for.

THE SIMPLEX ORE CRUSHER.

For crushing and pulverizing small quantities of ore by either hand or power. It is more easily operated than any other machine of its capacity on the market.

Its features are ease of opening for cleaning and simplicity of adjustment.

CALKINS' GYRATORY MULLER.

A recent invention for reducing crushed ore samples to a pulp. Will quickly pulverize to 100 mesh or finer.

Supersedes the slow and laborious Bucking Plate.

CALKINS' RADIAL BUCKING PLATE.

Designed to replace the old method of pulverizing crushed ore samples to a pulp of any desired fineness with but a fraction of the energy required to operate the old style Bucking Board and Muller.

F. W. BRAUN & CO.,

Manufacturers of Modern Appliances for Assayers,

LOS ANGELES, CAL.

THE FULTON VARIABLE MOTION CONTINUOUS FLOW MINING PUMP.

Delivers a continuous stream with absolutely no water hammer so common with all other makes of pumps. Is particularly adapted to be driven by electric power, for the reason the resistance to motive power is almost uniform. I manufacture the FULTON PUMP in four sizes, ranging from 10 H. P. work to 50 H. P. work.

WRITE ME FULL PARTICULARS IN REGARD TO YOUR REQUIREMENTS.

The above cut is made from a photograph taken of a No. 3 FULTON PUMP at work on the 600 ft. level in the Tesla Mine at Tesla, Alameda Co., Cal.

Read what MR. O. NEWHOUSE, Consulting Engineer of the S. F. & S. J. Coal Co., has to say in regard to it.

OFFICE S. F. & S. J. COAL CO., TESLA, ALAMEDA CO., CAL., July 13, 1900.

Mr. A. T. Ames, Galt, Cal.—DEAR SIR: Replying to your favor of recent date, regarding the working of the Fulton Pump bought of you, will say: The pump is one of your No. 3 pumps, working in connection with a Fulton Double X double plunger cylinder 5 in. diameter by 110 in. long. Stroke of each plunger 2 ft. This pump is installed in our mine on the 600 ft. level, directly over our stamp, and is forcing the water to the surface at one lift. We drive the pump with an electric motor. 30 H. P., direct connected to the pump with gear and pinion, and I am pleased to submit the following statement of duty:

Length of 6 in. column leading up incline to surface.....	895 ft.	Strokes double per minute, 2 ft.....	25
Perpendicular head.....	640.55	Discharge, measured by box center thereof, under 5 in. head, equal to 1 1/4 cu. ft., equal to gallons per hour.....	4725
Gauge pressure, actual.....	275 lbs.	Diameter of pump cylinder.....	5 in.
theoretical.....	273.14	Net area of pump cylinder after deducting area of piston.....	17.868 sq. in.
Barometer at pump.....	29.55 in.	Efficiency of pump when working under above conditions.....	54.83 per cent.
point of discharge.....	23.95		
Temperature air.....	53 deg.		
water.....	75 "		

To say that we are highly pleased with our pump expresses it very mildly.

Signed, O. NEWHOUSE, Consulting Engineer S. F. & S. J. Coal Co.

THE COLORADO IRON WORKS COMPANY,

ENGINEERS AND MANUFACTURERS OF

Smelting Furnaces and Equipments.

The illustration in this advertisement shows one form of our COPPER MATTING FURNACE, employing hot blast; the air being first treated in proper appliance, is conducted through the cast iron bustle pipes placed along the inside of the caisson plates, through the cast iron adjustable tuyeres. This furnace can also be used for silver as well as copper smelting, by changing lining in crucibles. We build them in any size required.

Cold blast may be used if preferred.

The furnace is equipped with our special cast iron jackets, and our patented system of water-jacketed mantles.

Send for our catalogue, showing many different styles of smelters for the treatment of

GOLD, SILVER, LEAD, COPPER AND NICKEL ORES,

also the latest and best method for the economical use of jacket water (a saving of 80% to 90% guaranteed) by our patented

WATER VAPORIZING ATTACHMENT.

We design, manufacture and erect Mills for Concentration and Amalgamation, Milling, Chlorination and Cyanide Processes. In writing for information, give us the analysis or character of the ore to be treated, to enable us to intelligently arrive at the proper method. Our very complete catalogue of CRUSHING MACHINERY will be sent on application.

A Dry Pulverizer

**FOR ORES, CEMENT and
HARD SUBSTANCES.**

Equals a 50-ton stamp mill. Grinds to any mesh under 8.
No silt, no choking. Takes any fineness of feed under 1 in.
No special foundation. No quartered belts.
No internal screens. Outside separation gives 100 per cent product most uniform and granular.
No oil in product. No stoppages for oiling or adjusting.
Can be used wet. Can be moved on a truck.
Guaranteed for one year. Free new for worn out parts.
Little wear, no duplicate parts, no break-downs.
Cost 1/4 to 1-10 of any installation of same capacity.
Takes only one-half the horse power. Is automatic.

For Particulars and Catalogue

KENT MILL CO., 5 Beekman St., NEW YORK.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

SMOOTH-ON COMPOUND AN IRON CEMENT

For repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat,
steam, water or oil, and expands and contracts the same as iron, insuring a tight joint at all tempera-
tures. Difficult flanged connections can easily be made with SMOOTH-ON COMPOUND, as it
adapts itself to the flanged faces, whether parallel or not. Connections are easily taken apart. Un-
equalled for boiler patching.

Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

NOTICE OF AMENDMENT OF ARTICLES OF INCORPORATION.

Notice is hereby given that it is the intention of the JAMISON MINING COMPANY to amend its Articles of Incorporation by substituting for the second of said articles setting forth the purposes of the Corporation, which now reads:

"2nd. That the purposes for which it is formed are: The acquisition of quartz mines and gravel mines in the State of California, and to work the same for gold and silver; also, to acquire, hold and use water and water-rights and privileges in connection with such mining; also, to acquire, hold and use timber lands in connection with such mining," the following:

Second.—That the purposes for which it is formed are: To mine for, and mill and reduce ores of all kinds; to acquire by location, purchase or otherwise, to own, hold, work and operate mines in and throughout the State of California; to acquire by purchase or otherwise, to own, hold, develop, improve, lease, let, mortgage, grant, bargain, sell and convey mines, and mining claims and properties in the State of California; to acquire, by purchase or otherwise, to build, erect, construct, own, operate, lease, let, mortgage, grant, bargain, sell and convey mills, and other reduction and smelting works, for the milling and reduction and smelting of ores, and to deal in precious metals and minerals and the products of mines of every kind, and to transport and provide ways and means to transport the same to market, and to market and sell the same; to acquire, by purchase or otherwise, to improve, develop, own, hold, use, lease, let, mortgage, grant, bargain, sell and convey real property, lands, water, water-rights, privileges, and franchises of every kind, in and throughout the State of California; to buy, own, hold, sell and generally deal in goods, wares and merchandise, and all kinds of personal property, including the stocks of other corporations, also bonds, notes and personal securities of every kind. To establish and maintain agencies of said Corporation, and to appoint and employ agents, wherever it may be deemed best by said Company; and generally to do any and everything necessary, proper or expedient to carry out the aforesaid purposes and carry on the business of said Corporation.

NOTICE OF STOCKHOLDERS' MEETING.

A Special Meeting of the Stockholders of the JAMISON MINING COMPANY for the purpose of considering and acting upon the matter of Amending its Articles of Incorporation, above provided, will be held at the office of the company, room 54, 120 Sutter street, San Francisco, California, at two o'clock P. M. on Monday, the 11th day of February, 1901.

By order of the Board at its meeting of December 31st, 1900. SAM W. CHEYNEY, Secretary Jamison Mining Company.

REDUCE THE COST of LIGHT

ORE BUYERS AND EXPORTERS. MINING SUPPLIES.

TREAT YOUR ORES, SAVE YOUR VALUES,

CONCENTRATE

AND :

AMALGAMATE

In substance at one operation by the

Hooper Pneumatic System.

Floor Space, 3x6 Ft. Weight, 2250 Lbs. Capacity, 10 to 50 Tons Daily.

WE USE NEITHER

WATER, CHEMICALS NOR QUICKSILVER.

Ores, etc., Treated:

Gold,	Copper,	Corundum,
Lead,	Chrome,	Antimony,
Zinc,	Nickel,	Cinnabar,
Mica,	Clays,	Black Sands,
Tin,	Garnet,	Any Sands,
Slags,	Graphite,	Mixed Ores,
Silver,	Fluor Spar,	Metallic Ores.

SAMPLE LOTS TREATED FREE.

WRITE FOR SHIPPING TAGS.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says: "It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cid., N. C., says: "Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says: "Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, silty or rebellious ores. Zinc and lead combinations handled in good shape

THE TRENTON IRON COMPANY, of TRENTON, N. J., desires to inform its patrons that they have just issued a new book of 48 pages, entitled "Wire Rope and Its Application to the Transmission of Power, Etc.," which is well illustrated, and replete with valuable tables. It contains information of a general character concerning wire rope, and its special applications to the transmission of power, suspension bridges, etc.; also matter relating to wire rope fittings, sheaves and tackle blocks. It is distinct from the previous publications of the Company on the subjects of Wire Rope Tramways, Cable Hoist Conveyors, and Wire Rope Haulage, and should not be confounded with these in any way. The book will be mailed upon application, free of charge, to engineers, contractors, and all users of wire rope.

Most reliable for controlling steam and other fluids. Can be reground, if necessary, while valve is in position on steam pipe.

THE CALIFORNIA DEBRIS COMMISSION. HAVING
 received applications to mine by the hydraulic
 process from John Costa et al., in the Lady's Canyon
 Mine, near Sierra City, Sierra Co., to deposit
 tailings in worked-out pits; from W. B. Dudley et
 al., in the Dudley Placer Mine, near North Columbia,
 Nevada Co., to deposit tailings in a worked-out
 pit; from the Eagle Gold Mining Co., in the
 Reichel Claim, near Mountain Ranch, Calaveras
 Co., to deposit tailings in Murray Creek; and from
 the Emery Gold Mining and Water Co., in the Rose
 Hill Mine, near Mountain Ranch, Calaveras Co., to
 deposit tailings in Murray Creek, gives notice that
 a meeting will be held at Room 59, Flood Building,
 San Francisco, Cal., on January 14, 1901, at 1:30 P. M.

ASSESSMENT NOTICES.

NATIONAL CONS. MINING COMPANY.—Location
 of principal place of business, San Francisco,
 California; location of works, Rich Gulch, Shasta
 County, California.

Notice is hereby given, that at a meeting of the
 Board of Directors, held on the 1st day of December,
 1900, an assessment (No. 13) of five (5) cents per share
 was levied upon the capital stock of the corporation,
 payable immediately in United States gold coin to
 the secretary, at the office of the company, 773
 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain
 unpaid on the 10th day of January, 1901, will
 be delinquent, and advertised for sale at public
 auction; and unless payment is made before, will be
 sold on MONDAY, the 11th day of February, 1901,
 to pay the delinquent assessment, together with the
 costs of advertising and expenses of sale.

By order of the Board of Directors.
 GEO. W. FLEISSNER, Secretary.
 Office—773 Mission St., San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location
 of principal place of business, San Francisco,
 California; location of works, Mariposa
 County, California.

Notice is hereby given, that at a meeting of the
 Board of Directors, held on the 24th day of December,
 1900, an assessment (No. 20) of Ten (10) Dollars
 per share was levied upon the capital stock of the
 corporation, payable immediately in United States
 gold coin, to the secretary, at the office of the company,
 320 Sansome street, room 24, San Francisco,
 California.

Any stock upon which this assessment shall remain
 unpaid on the 11th day of February, 1901, will
 be delinquent, and advertised for sale at public
 auction; and unless payment is made before, will be
 sold on SATURDAY, the 2nd day of March, 1901,
 to pay the delinquent assessment, together with the
 costs of advertising and expenses of sale.

By order of the Board of Directors.
 JOSEPH H. MOORE, Secretary.
 Office—320 Sansome street, room 24, San Francisco,
 California.

GOULD & CURRY SILVER MINING COMPANY.—Location
 of principal place of business, San Francisco,
 California; location of works, Virginia, Storey
 County, Nevada.

Notice is hereby given, that at a meeting of the
 Board of Directors, held on the 4th day of December,
 1900, an assessment (No. 93) of ten (10) cents per
 share was levied upon the capital stock of the corporation,
 payable immediately in United States gold coin, to
 the secretary, at the office of the company, room 69
 Nevada block, No. 309 Montgomery street, San Francisco,
 California.

Any stock upon which this assessment shall remain
 unpaid on the 7th day of January, 1901, will be
 delinquent, and advertised for sale at public
 auction; and unless payment is made before, will be
 sold on MONDAY, the 28th day of January, 1901,
 to pay the delinquent assessment, together with the
 costs of advertising and expenses of sale.

By order of the Board of Directors.
 ALFRED K. DURBROW, Secretary.
 Office—Room 69, Nevada block, No. 309 Montgomery
 street, San Francisco, California.

MAY DAY GOLD & SILVER MINING COMPANY.—Location
 of principal place of business, San Francisco,
 California; location of works, Calaveras
 County, California.

Notice is hereby given, that at a meeting of the
 Board of Directors, held on the 28th day of November,
 1900, an assessment (No. 5) of five (5) cents per
 share was levied upon the capital stock of the corporation,
 payable immediately in United States gold coin, to
 the secretary, Edward H. Stearns, at his office,
 Room 301 Claus Spreckels Building, Cor
 Third and Market Sts., San Francisco, California.

Any stock upon which this assessment shall remain
 unpaid on the 8th day of January, 1901, will be
 delinquent, and advertised for sale at public
 auction; and unless payment is made before, will be
 sold on TUESDAY, the 19th day of February, 1901,
 to pay the delinquent assessment, together with the
 costs of advertising and expenses of sale.

By order of the Board of Directors.
 EDWARD H. STEARNS, Secretary.
 Office of the Company—Heald's Business College,
 24 Post St., San Francisco, California.

SILVER KING MINING COMPANY.—Location of
 principal place of business, San Francisco, California;
 location of works, Pioneer Mining District
 Pinal County, Arizona Territory.

Notice is hereby given, that at a meeting of the
 Board of Directors, held on the 13th day of December,
 1900, an assessment (No. 22) of twenty-five (25)
 cents per share was levied upon the capital stock of
 the corporation, payable immediately in United States
 gold coin, to the secretary, at the office of the company,
 No. 310 Pine street, Room 38, San Francisco,
 California.

Any stock upon which this assessment shall remain
 unpaid on the 22d day of January, 1901, will be
 delinquent, and advertised for sale at public
 auction; and unless payment is made before, will be
 sold on TUESDAY, the 19th day of February, 1901,
 to pay the delinquent assessment, together with the
 costs of advertising and expenses of sale.

By order of the Board of Directors.
 J. W. PEW, Secretary.
 Office—310 Pine street, Room 38, San Francisco,
 California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location
 of principal place of business, San Francisco, California;
 location of works, Placer
 County, California.

Notice is hereby given, that at a meeting of the
 Board of Directors, held on the 11th day of December,
 1900, an assessment (No. 23) of one-half cent per
 share was levied upon the capital stock of the corporation,
 payable immediately in United States gold coin, to
 the secretary, at the office of the company, Room 31,
 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain
 unpaid on the 15th day of January, 1901, will be
 delinquent, and advertised for sale at public
 auction; and unless payment is made before, will be
 sold on TUESDAY, the 5th day of February, 1901,
 to pay the delinquent assessment, together with the
 costs of advertising and expenses of sale.

By order of the Board of Directors.
 GEO. W. DIXON, Secretary.

THE "JAMES" AUTOMATIC ORE FEEDER.

THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

Shipping weight, with wood frame, - 800 pounds.

" " " iron " - 1000 "

ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

Progress in Explosives.

In the last volume appeared herein a series of articles on high explosives giving the details of manufacture and their relative efficiency in mining operations. This department of science has exhibited some progress in the last quarter of a century.

In 1873 the only prominent explosives, other than gunpowder, were dynamite and a few preparations of nitrocellulose. Nitroglycerine and nitrocellulose—the only explosives of the kind in use in 1873—are still the main ingredients of the bulk of explosives as now manufactured; sixty-two of the eighty-one explosives on the list consist mainly of either nitroglycerine or nitrocellulose, or of a combination of the two. Scientific knowledge regarding the character of explosives has, however, greatly increased, and it is now generally possible to form a fair estimate of the possible value of any explosive from its composition alone. Thermo-chemistry has made great strides in the interval; and though it is not advisable in this, as in anything else, to rely on theory alone in the selection of explosives for any particular use, it becomes a factor in such selection. General knowledge regarding the conditions to insure safety have also greatly advanced.

Because of the genius of the late Alfred Nobel, nitroglycerine has been converted into a gelatinous solid, free from the danger attached to the use of liquid nitroglycerine, almost as powerful, and readily lends itself to the production of explosives of varying power and intensity of action. This invention, owing mainly to insisting on the production of a blasting gelatine free from the dangers of liquefaction and exudation, has led to increase in knowledge of the character of nitrocellulose.

In 1873 nitrocellulose was divided practically into two kinds only—so-called insoluble nitrocellulose or guncotton and soluble nitrocellulose or collodion cotton—the solvent implied being a mixture of ether and alcohol. Now it is of common knowledge that solubility in ether or alcohol is not, as was supposed, a function of the degree of nitration, but solely one of method of manufacture. Nitrocellulose of very vary-

ing degrees of nitration, up to tri-nitrocellulose, can now be manufactured soluble in the above mixture. The most remarkable and far-reaching advance in the use of guncotton and nitroglycerine—an advance based, in a measure, on the discovery of blasting gelatine by Alfred Nobel—is the recognition of the fact that, by converting these two materials into hard homogeneous non-porous solids, they lose their character of detonating agents, and may be used as effective propellants. The rate of combustion of these gelatinized explosives is under perfect control, inasmuch as they burn only on their surfaces by varying the relation between weight of explosive and surface exposed. Almost all smokeless powders, which have added so much to the power and utility of modern guns, are based on this discovery.

Another important advance, owing mainly to Dr. Sprengel, is the substitution of ammonium nitrate for saltpeter in many explosives. The value of this compound lies partly in the fact that it leaves no solid residue on combustion, partly that it reduces the temperature of explosion of all explosives in which it is employed. The latter fact chiefly renders it so valuable an ingredient in the so-called safety explosives. A great drawback to its use, however, is its property of rapidly absorbing moisture from ordinary atmospheric air, which renders a waterproof wrapper or case necessary.

The type of smokeless powder consisting of pure guncotton was developed by the French. Nobel developed a successful smokeless powder by combining soluble collodion cotton with nitroglycerine. H. S. Maxim was the first to make a smokeless powder consisting of nitroglycerine and true guncotton. The first to patent it and the first to use it, Maxim was also the first to combine oils and paraffines with smokeless powder to prevent detonation.

Concurrently with the introduction of ammonium

nitrate came the use of various nitro derivatives of the so-called aromatic compounds, which, though usually not of a composition to serve as explosives by themselves, yield powerful explosives in admixture with ammonium nitrate.

The only compound of this class which is at present largely used as an explosive by itself is tri-nitrophenol or picric acid, which, now known as a powerful detonating explosive, was manufactured for many years, and in considerable quantities, as a valuable yellow dye, without a suspicion of, and with utter disregard to, its highly explosive character. It furnishes a striking illustration of the danger involved in proclaiming an explosive to be perfectly safe on the strength of its having been manufactured and used for some years without accident.

Nugget Stamp Mill, Boulder Co., Colo.

Herewith is presented a mountain view typical of that section of Colorado, showing the Nugget 10-stamp mill, with plates and Cammet concentrators, which was recently started up. The power is supplied by a Stilwell-Bierce water wheel, operated from a 1-mile water pipe line. There is, however, an auxiliary steam power plant in the mill. The 1000-foot tramway line shown conveys the ore from the mine, which is located at a higher point. John L. Tidball of Crete, Neb., is largely interested in the property, with L. H. Dennison as manager. The stamps and other iron work were turned out of the Denver shop of McFarlane & Co., Hendrie & Bolthoff of Denver, Colo., having the contract to supply all the machinery.

Vulcan Iron Works, Seattle, Wash.

The accompanying engraving portrays the new and enlarged establishment of the Vulcan Iron Works Co., of Seattle, Wash., which among other things is just now making a record in shipping logging engines, as shown in the engraving. The mining activity in Alaska, British Columbia, Washington and Oregon has encouraged this establishment in increased manufacture of mining machinery as well as mill and marine supplies. Jacob Furth is president of the company; H. P. Strickland, secretary, and Isaac Hulme, general manager.

ONE of the reasons why mining men everywhere like this paper and constantly read it is because of the practical articles written for it by experienced men who do the things they write about, and who, because of their ability, have charge of big enterprises. For instance, in this issue is the second and concluding part of an article on how to work an inland gold dredger, written by a man who has made a specialty of that kind of work in California. Any one who reads that article and is at all interested in gold dredging feels that he has there the latest and best that can be said thereon, not from a theoretical point of view, but from the standpoint of one who has studied out many theories, tried them, adopted some, discarded others, and made a financial success of his work. Another article on how to treat a flat wire rope used in mine hoisting is written by the master mechanic of the Portland Gold Mining Co. at Victor, Colo. Like the article on dredging, the one on the homely, but important subject of proper treatment of a wire hoisting cable, is written by an expert. That article tells how to save men's lives. Mr. Eteson's article tells how to save and make money. Both are written by specialists in their respective lines, and mining men everywhere are always interested in anything that tends to increased safety of life or economy of operation. The special article on high-pressure centrifugal pumps, by Jno. Richards (whose name is known in both continents), is believed to be the first publication of the matter in this country. It is characteristic of broad gauge miners, metallurgists and engineers to interchange knowledge that results in common benefit, and, through the years, a large store of valuable information has thus been afforded in that way through our columns. Of course all men do not think alike. There are men who believe it a business mistake to tell what they call "trade secrets;" but, as a general thing, those men never rise above the dull level of mediocrity. The fact that they fear that others may find out as much or as little as they know stamps their caliber. Such small-minded views of life are not consistent with the dignity and progress of the day. The man who jealously conceals what he is pleased to think he alone knows will end by thinking that he knows it all. None of us know much, but by general contribution the common stock of knowledge is increased. The fact that a man knows or thinks he knows something of value should be the strongest incentive to tell his fellow workers in the same

line of business, for the day is gone by when any one can expect to make such knowledge of exclusive advantage to himself. It is only by securing the attention of others that knowledge becomes truly valuable, and it is by publishing it in the columns of a widely distributed periodical that such information can be made of most value to himself or any one else.

A Mistaken Assumption.

Much has been said by this paper in past years regarding the province, purpose and manifest necessity of a cabinet department of Mines and Mining, and the value shown of so obviously worthy a measure. There is noted the December meeting of the Central Mining Institute of western Pennsylvania, on which occasion the principal topic of discussion was "Would the Establishment of a National Mining Bureau at Washington Promote the Advancement of the Science of Mining and be Conductive to the Interests of the Mining Industry in General and be a Benefit to the Public at Large?" The discussion thereon appears to have taken the form of an assumption that the U. S. Geological Survey was not doing good work, and that because of this the establishment of such a department was necessary to aid the mining industry, the idea being a sort of antagonistic one in general to the U. S. Geological Survey. It is unfortunate that the friends of the measure in western Pennsylvania so misunderstand the whole purport of the effort as to feel called upon to make any attack, either implied or direct, upon the U. S. Geological Survey. The U. S. Geological Survey is not at all in evidence in the matter, nor are its valuable services in any way questioned. There is no antagonism between the U. S. Geological Survey and the proposed cabinet department of mining. The two things are entirely distinct and separate, and those who have given the matter serious attention understand this perfectly; nor is there any antagonism on the part of the U. S. Geological Survey officers against the proposed measure. We have the assurance of several of them that they feel kindly disposed toward the proposition, recognizing its necessity and value and that it can in no way interfere with their legitimate work, but would rather tend to aid and promote it. The whole thing illustrates the tremendous amount of public ignorance on that subject, even among those who by reason of their position would naturally be supposed to know something about it, and that is the one almost insuperable obstacle in the way of success.

The idea of those who want a cabinet department of mines and mining created is not of antagonism or of superseding anything of merit, but to create an opportunity not now existing for further development of the mining industry and for intelligent and final adjudication of matters constantly arising that are not susceptible of proper solution either by the legislative or judicial functions of the Government, but which naturally belong to the executive management thereof. It is not uncommon to have contradictory rulings follow each other from subordinates in the office of the Secretary of the Interior on precisely the same question, and it tends to mix the ordinary mining man up considerably to be told that "he can and he can't; he will and he won't; he'll be damned if he does, and be damned if he don't." There are increasing difficulties every year that can only be removed by the creation of the department advocated.

The idea in general is to introduce the same progressive system in all matters relating to the mining industry of the United States that has been introduced concerning other branches of the public weal not more important than the great basic industry of the nation. Where rightly understood this manifest necessity and justice makes friends and advocates everywhere, but it would appear that there are times and occasions when it has more to fear from its friends than from its foes—when the former mistakenly attempt to advance its progress by attacking such an institution as the U. S. Geological Survey, that only deserves unanimous praise for efficient public service.

The Leadville, Colo., News-Reporter issued an illustrated New Year's edition, edited entirely by volunteers. The exchange editor starts out by saying: "The first paper I opened was the MINING AND SCIENTIFIC PRESS." Of course.

Stamp Milling Methods.

The difference between the "California" and "Colorado" systems of stamp milling has been so exhaustively discussed that little remains to be said on that point.

Ordinarily in California quartz mining, gold ores consist principally of quartz and schists carrying free gold and rarely more than 4% sulphurets, the oxidized ores sometimes extending to a depth of 750 feet. The rapid-drop California stamp mill, effective in crushing and simple in amalgamation, secures good results, saving from 80% to 95% in treating free gold ores with the minimum amount of sulphides.

So far as surface ores are concerned, there is little difference between those of California and Colorado; but in the latter State the oxidized area extends to a depth much less than in California—sometimes less than 100 feet—and below that carries a far greater proportion of sulphides than do the California ores at any ordinary depth. To successfully treat those sulphides the Colorado slow-drop, fine-crushing system, with its introduction of amalgamated plates inside of the mortar and the production of a maximum amount of slimes, seems more satisfactory to some, though in many instances the "Gilpin county bumper" and the slow-drop stamp are being replaced by other makes of concentrator and rapid-drop heavier stamps. Miners of Clear Creek, Colo., claim that better results are obtainable from the slow-drop, double-issue stamp mill than from the heavy-stamp, quick-drop, single-issue mill; that in the former a larger percentage of the gold is saved in the batteries and tables, the wear and tear much less, and that, while some gold goes off in the tailings, it is obtained by concentration and sale to the smelters. They hold that the latter named mill wears out faster in shoes and dies, that the screens are crowded, the crushing not fine enough to permit general amalgamation; that they prefer to have richer plates and leaner concentrates.

It is not so much a difference between California and Colorado systems as it is a question of suiting the process to the ore, which is always more desirable than trying to suit the ore to the process.

Whether it be Utah, Arizona or British Columbia, the "California" system would doubtless be most satisfactory for the kind of ore most ordinarily found in California and the "Colorado" system equally efficacious for such classes of ore as that found therein. The name is of less importance than the adjustment of methods.

It is believed, however, that modern methods of stamp milling and general treatment of low-grade ores suggest the economic advisability of coarse concentration followed by amalgamation. This matter of concentration is of prime importance, and is taking precedence in the minds of many progressive millmen over the old threshed-out question of drops and weights and duties of stamps.

Sulphide ores are extraordinarily friable, and hence fine crushing occasions the production of considerable slimes, in which are frequently carried off, mechanically, a large percentage of the gold contents of the ore. Coarse crushing and improved concentration methods can reduce to a minimum the production of such slimes, the contained particles of sulphides being coarser and more readily separated from the worthless gangue, and the tailings after the separation of such heavy sulphides, if containing gold, in good condition for treatment by amalgamation.

WHETHER it is best for a district or not to have "foreign" capital develop it, is again being discussed, the singular argument being advanced as it occasionally is, that "foreign" capital is objectionable inasmuch as the profits go out of the country. It really makes very little difference whether the capital to develop a mining district is "foreign" or domestic. It is development that most districts need, and that always requires money, and it is of minor import where that money comes from. No one should grudge the profits resultant to such investment, even though they be "carried out of the country," as nine dollars are left behind for every one dollar carried away. The wage earner, the manufacturer, the local merchant, all come in for a share of such disbursement, and the life and prominence imparted to a district aids further exploitation.

Concentrates.

WATER can be pumped out of a closed tank if the tank is not air-tight.

AT 100 pounds gauge pressure steam weighs .264 pound per cubic foot.

"THE cost of a horse power" at Niagara Falls, N. Y., is \$17.50 per electrical horse power per year.

THE copper production of the United States for 1900 is estimated at 603,000,000 pounds of fine copper.

THE altitude of the Payne mine, Slocan, B. C., is 7200 feet. There exist there both fissure and bedded veins.

THE largest consolidated gold fund in the world is in the United States Treasury. On the 1st inst. it amounted to \$479,349,250.

THE recent published vagaries of Nikola Tesla are not to be given serious attention and are interesting only for their notable absurdity.

AUSTRALIA requires mine superintendents to be licensed, and fines a miner for returning to a missed-fire shot within three hours' time.

CHEMICALLY pure lead is not in sufficient demand to be quoted commercially, but can be had from any prominent dealer in assayers' supplies.

SODA ASH is the most economical substance to use for neutralizing in a boiler the bad effect of feed water strongly impregnated with H_2SO_4 .

SILICIFIED fossil trees are found in Arizona and Montana, in the latter State 3 miles south of Sun river, in the northern part of Lewis & Clarke county.

A CAST-IRON BALL $6\frac{3}{4}$ inches diameter will weigh 30 pounds; $6\frac{3}{4}$ cubed=220.34; that multiplied by .5236=115.37=cubic inches; that $\times .26=29.99$ pounds.

AN affidavit of assessment work recorded within six months after the time within which the labor had to be performed is prima facie evidence of such labor.

THE efficiency of a steam engine is about 15% of the power due to the heat generated by the fuel. The efficiency of a gas engine is about 34% of the total heat units generated by the fuel.

TRACTION ENGINES have hauled thirty tons ore daily, a distance of 30 miles, over a road with long 10% grades from Bisbee, Arizona, at an estimated cost for labor, fuel and oil of 27 cents per ton.

IN one form of use of the cyanide process the ore is treated in revolving barrels, instead of in a vat, the company claiming that the percentage of extraction is greater and the time required less.

AT the Green Mountain mine, one of the Anaconda, Montana, copper properties, copper has been found by the diamond drill at a depth of 2200 feet. The High Ore shaft is to have a depth of 4000 feet.

ASSESSMENT WORK by the locator of a claim who had previously failed to do assessment work upon the ground, so that it was subject to relocation, will prevent any relocation by other parties subsequent to the performance of such work.

THERE is no silver or gold mine in Colorado below an altitude of 7500 feet, and few below an altitude of 8000 feet. There are several gold mines in California the bottom workings of which are from 300 to 500 feet below sea level.

UNDER the present tariff law all coal containing less than 92% of fixed carbon is classed as bituminous coal, and if exported is liable to a duty of 67 cents per ton. This construction excludes anthracite coal from the free list altogether.

ASSESSMENT WORK may be done beneath the surface, on a lode having its apex outside the surface line, or upon other claims or other ground in reasonable proximity to the claim if tending directly to the development or improvement of the claim.

NO ACCURATE statement of the gold or silver yield of any State or Territory for the past year has yet appeared, and necessarily can not be made for the next three months. The 1900 gold yield of California is greatly understated in all the estimates yet made.

IT will be forty-two years on the 21st inst. since Geo. Jackson made the first recorded discovery of gold in Colorado, at Jackson's bar, now Idaho Springs. It will be fifty-three years on the 19th since Jno. W. Marshall made the historical discovery of gold at Coloma, Cal.

TO SOFTEN cast iron for drilling, heat to a cherry-red, having it lie level in the fire; then, with tongs, put on a piece of brimstone, a little less in size than the hole is to be. This softens the iron entirely through. Let it lie in the fire until slightly cooled, when it is ready to drill.

THE lighter hydrocarbon oils are the first distillate from crude petroleum. The vapors pass through the same still as the heavier oil, but are switched off into separate tanks as the gravity of the distillate increases. The gravity is tested as the liquid flows by a hydrometer.

WOODEN water pipe might be used to advantage, and if made of staves and bound together with iron hoops are capable of standing considerable pressure, as high as 100 pounds to the square inch, but iron and steel pipe is now so cheaply made that economy would not suggest the general use of wood for piping.

A CIRCULAR tapering tank, diameter at the bottom 60 inches, diameter at top 48 inches, height 10 feet, filled with water to one-half its height, has in it 663 gallons—

diameter at water line $60+48+2=54$ inches; $60^2 \times 54^2 : (60+54) \times .7854 \times 60 \div 3=153,247$ cubic inches, divided by 231=663 gallons.

IN the chlorination process the more copper in the ore the greater the consumption of chemicals. Where pyrites are copper-bearing forty to fifty pounds bleach and that equivalent amount of sulphuric acid may be required, while where clear iron pyrites are treated only ten or fifteen pounds are necessary.

AN alloy for a dynamo brush to combine conductivity with the minimum of friction is copper with .2% of bismuth, .3% of cadmium and 1.5% of antimony. If the commutator is of hard bronze, the ingredients added to the copper should be doubled in quantity; and if the commutator is of steel, they should be trebled.

'Tis hard to restore burnt steel. The following may serve: Borax, 3 ounces; sal ammoniac, 8 ounces; prussiate of potash, 3 ounces; blue clay, 2 ounces; rosin, $1\frac{1}{2}$ pounds; water, 1 gill. Put all over a slow fire; let it simmer till it dries to a powder; heat the steel to a cherry-red, dip into this powder and afterward hammer.

IN manufacturing sulphuric acid in San Francisco or at sea level the chamber space needed is from 20 to 25 cubic feet per pound of sulphur burned in twenty-four hours. At Denver, Colo., as the altitude entails a smaller weight of oxygen in a certain cubic space, the chamber for such manufacture would have to be about 10% larger than at sea level.

WHERE three men carry a log 18 feet long of equal weight throughout, one man at the end, the other two using a cross stick, the weight equally distributed, the cross stick is to be placed $4\frac{1}{3}$ feet from the end of the log. In that way the two men holding it will each carry one-third the log's weight and the man at the end will carry the other one-third.

A GOOD semi-liquid belt grease can be made as follows: Melt 6 kilograms of perioline, 2.5 of fish oil, 5 of resin, 2.5 of wool fat, and add 1 kilogram of gum solution, and, when stirring, 1 kilogram of tallow. Pour the mass into suitable vessels and continue stirring until cool. If it is wanted in sticks, add to the mixture 10 kilograms of resin and 7 of ceresine, and mould and shape to suit.

PYROZONE is the druggists' name for peroxide of hydrogen, a 3% solution of H_2O_2 in permanent solution, for internal or external use, and an antidote for cyanide poisoning. In such case the stomach is washed out with it and hypodermic injections made every five minutes in different parts of the body. It forms, with the hydrocyanic acid, the harmless chemical compound oxamide.

METALLIC GOLD is not dissolved by any single acid. It is acted upon by acid mixtures, such as nitromuriatic, which liberate chlorine. It also dissolves when heated with strong sulphuric acid and a little nitric acid. According to all accessible authorities, gold is insoluble in a "nitric acid in which there has taken place a decomposition, and some of the nitrous acid group has been liberated."

THERE are no overlapping mining claims in Mexico. The Government makes no distinction between a native and a foreigner; either may denounce mineral veins which have no legal owner by paying the regular fee for each pertenencia (a square 100 meters on each side). An annual tax of \$10 for each pertenencia is required by the Government. Ownership is forfeited by a failure to pay this tax, and not by a failure to work the mine.

IN the Houghton, Mich., copper district the shaft a mile deep, mentioned last week, is on the amygdaloid, an old lava flow, the fissure veins having all pinched out at a depth of between 2000 and 3000 feet. The mass of mines were usually opened on the fissure veins crossing the formation transversely. Masses of copper of several tons weight are found in the Quincy and other amygdaloid or conglomerated lodes, but nothing as large in size as those found in the fissure veins.

ON the northern coast of California, near Gold Bluff, gold-bearing beach sands are still profitably operated. The panning surfs of the ocean act as gigantic concentrators. There are two kinds, the "straight in surf" and the ordinary panning surf. The "straight in" is occasioned by the western wind, accumulating the sand upon the seashore. The panning surf comes with a northwest or southwest wind, exercising a rocking motion on the cumulative sand heaps, panning them down and preparing the material for the puny appliances of the beach miner.

IN CHLORINATION, lead in the ore occasions an extra consumption of chlorine, though a heavy galena percentage in gold ore concentrates usually indicates considerable accompanying silver, which, in chlorination, is not wholly satisfactory. Unless a chloridized roast is used, lead, even in considerable quantity, does not materially affect the fineness of the precipitate, but the addition of even a small amount of salt to the roasting ore converts quantities of lead into chloride, which, being dissolved and finding its way into the gold tanks, is there thrown down as sulphate, to the deterioration of the gold precipitate, the result being a base bar.

TO WORK flat placer ground where there is no fall for head of water or tailings, a good gold dredger, or, if practicable, a hydraulic elevator could be used to advantage. A primitive plan put into successful practice in working flat placers in Montana is to build a line of sluices from 10 to 15 feet above the ground, supported by posts. The sluices should have a fall of not less than 4 inches in 12 feet, or more if both the gold and gravel

are coarse. The water is pumped up in the head sluice, the gravel carried up dry by a bucket elevator and slid into the sluice box, where it mingles with the water, the gold being caught in the riffles in the sluice boxes, the gravel out of reach of the elevator being brought from a short distance by scrapers, the pump and elevator to be moved when the distance became too great.

CONCERNING tempering drills for hard rock a California drill sharpener says: "I find it necessary to pay particular attention to the heating of steel; heat slowly and not overheat. After sharpening drills to suit convenience, lay aside to cool; then make a clear fire, heat drills to cherry-red (for ordinary steel, the heat to be regulated by results obtained); then plunge in clear water. Next I take a box about 2 feet long, 2 inches deep, 4 inches wide, with only one end in it, into which I throw a handful of sand, then take the tempered drills and rub briskly across the sanded bottom five or six times in order to put a little polish on the drills to better observe the change of color when drawing the temper. Next place a bar across the top of the fire, lay the drills on the bar over a slow fire, and when you find the temper to a very light straw, dip in water just for one moment, then throw on the floor to cool; when cool they are ready for use."

THE rusty gold in the Snake river, Idaho, placers is caught on a copper-silver plate rocker, the setting of which requires dexterity. The plate is first annealed, roughed with nitric acid, brightened with cyanide of potassium, then a little silver nitrate is put on with the quicksilver, the silver being subsequently partially removed with nitric acid. The plate is next set with gold, the little gold specks not left loose but set hard with fire, this leaving the plating very rough. Finally quicksilver is put on, and the gold slightly smoothed with a spatula. The plate is now full of little pockets or riffles, which catch and retain the coated gold until it is brightened by cyanide or cut with acid. The ordinary smooth plate with soft silver amalgam could not do the required work. This rough plate, however, though wet with quicksilver and set at a steep grade, retains the rusty gold. The "burlap process" works well where there is no slime or magnetic sand. That was described on page 609 of the issue of Dec. 29, 1900.

THERE is a metallic alloy invented and patented in Germany to take the place of gold, which, even if exposed for some time to the action of ammoniacal and acid vapors, does not oxidize or lose its gold color. It can be rolled and worked like gold and has the appearance of genuine gold without containing the slightest percentage of that metal. It is much cheaper than other compounds and alloys used as substitutes for precious metals. The alloy consists of copper and antimony in the approximate ratio of 100 to 6 and is produced by adding to molten copper, as soon as it has reached a certain degree of heat, the antimony. When the antimony has been thoroughly diffused with the copper, charcoal ashes, magnesium and lime-spar are added to the mass when the latter is still in the crucible. The action of this material admixture of flux is not explained, but the alloy loses thereby a certain porosity otherwise present and greater density of the cast metal is obtained.

LAND from which timber is felled or removed under the provisions of the Act of June 3, 1878, must be known to be of a strictly mineral character, and that it is not subject to entry under existing laws of the United States except for mineral entry. The authority granted by the Act of June 3, 1878, to cut timber applies exclusively to lands which are strictly mineral in character and subject to mineral entry only. The defendant in any suit brought by the U. S. must prove by a preponderance of evidence that such lands are more valuable for the mineral than for any other purpose, and that they are not suitable for agricultural purposes or cultivation or valuable solely for the timber thereon. Parties who take timber from the public lands under assumed authority of said Act of June 3, 1878, do so at their own risk, and must stand prepared to show that their acts are within the prescribed terms of the act granting such privilege; in other words, the burden is on such parties of proving by a preponderance of evidence that the land from which the timber is taken is "mineral" within the meaning of said act, should the question at any time be raised as to the character of the land.

THE invention for working low-grade gold-bearing ores by means of magnets referred to is probably the one devised by J. A. Ogden, who is reported to have successfully run a small plant in Deadwood, S. D. The machinery consists of a 20 H. P. engine, a dynamo and a roaster. The ore is pulverized to a fine mesh, fed into the upper end of the roaster (which is nothing but a long piece of sheet iron, at an incline, under which a fire is built), and screened through an 80-mesh screen. The ore is then carried to the magnetic separator. The pulverized ore is dropped upon a wide belt, across which there are three narrow belts running at right angles. Above each narrow belt there is a large magnet, kept alive by the electricity generated in the dynamo. The ore passes under these magnets, which pick up the grains of iron, to the under side of the narrow belts running crosswise to the large belt. As soon as the iron is carried out of the magnetic field, a distance of 10 inches from the wide belt, it is then dropped into a hopper, which conveys it to a bin, nothing being left on the main belt except the sand and such gold as may have been freed by the roasting. The sand is then run over amalgamating plates and the concentrates shipped to the smelter.

Suggestions on Inland Dredging.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by P. B. ETESON.*

In the previous article I dealt with the starting of an inland dredger and the opening up of a face. I now propose to deal with the handling of different kinds of ground.

I have met many people who, when they come on board a dredger and see a man merely operating levers, think that dredging is child's play, and that any one, as soon as he has mastered the mechanism of the winch, knows all about it.

Now, that is the greatest mistake. Winching can not be learned offhand; it takes time and the handling and working of various kinds of ground before a man becomes at all proficient. It is also not merely a

the bottom, for the reason that after a certain quantity has been dug a larger quantity will break away, or cave, and feed the buckets, so that the buckets will have easier digging, and thus use less power and have less wear and tear.

Boats that work down in successive cuts do not have this advantage to so large an extent, and have to dig for more bucketfuls.

I am referring only to moderately hard ground. There is ground that has to be blasted before the dredger comes up to it.

All bucket dredger men know that when the ladder is flat, and digging shallow, the buckets are farther away from the delivery plate than when the ladder is more perpendicular and dredging deep. This, when working land and material that do not deliver freely, causes considerable trouble, for not only does one lose values, but the well hole gets filled up.

The best method to overcome this is to dig as deep as you can, thus keeping your buckets as close to the

work as deep as possible, and by this means the top dirt will mix with the gravel and will deliver more freely.

When very large quantities of sand are encountered above, as well as below, water level, a sand pump taking the sand from one or, if necessary, both sluices and discharging it behind the line of tailings will be found invaluable. I have successfully worked a bank of 29 feet of pure sand—13 feet above water and 16 feet below water, with 4 feet of gravel—for a distance of 150 yards with a slip chute, and a sand pump taking half of the sand.

There are two kinds of bedrock, hard and soft. With the former I have not had much experience, so will deal only with the latter.

I do not advocate side feeding into a high bank, be it tight or loose.

If it is tight, you work it with the side of your bucket lips, and so at a disadvantage; and if loose, you get big caves, which bury your ladder, and if you have a combination winch you lose time in hoisting your ladder or pulling out of the cave.

Work down to bedrock, raise your ladder 6, 8 or 10 feet—according to the ground you are working—move over 4 feet or more, and work down to bedrock again. Repeat this till you have worked over 20 or 30 feet of your face. Now, on the bedrock you will have a series of small mounds, which will not have sufficient body in them to cave and stall your buckets, if of a loose nature; and if hard, it will not have the same solidity as if working into the solid bank.

Now, by keeping the buckets on bedrock and side feeding back, the whole of these mounds can be picked up and the bedrock cleaned perfectly. When this is done push back to where you left off, and repeat. You might work the whole of your face and clean up after, but I advocate cleaning small patches, as you are not so likely to miss any ground, and the ground being kept up to a more finished state as work proceeds.

The Treatment of Flat Hoisting Cables.

Written for the MINING AND SCIENTIFIC PRESS by A. E. JOHNSON.

My experience extending over a period of 20 years in the use of flat cables has convinced me that much, if not nearly all, of the troubles attending the use of such cables can be avoided by giving them just the care and treatment that they require, and that most of the failures are directly traceable to ignorance of those responsible for their care.

It is true that in some instances flat ropes have been turned out of the factory that, owing to carelessness in sewing, have had the strands unequally strained to such an extent that any amount of subsequent care and treatment would fail to bring them to a good condition. In such cases, which I believe are comparatively rare, the only remedy is to renew all such portions that show an unequal tension of the strands.

The following are some of the points we must attend to if we expect to get good service from a flat rope in mine work:

First—See that the reel and sheave wheel are in proper alignment and the sheave wheel shaft is set level; any neglect in this is likely not only to cause an unequal strain on one side of the rope tending to distort it and pull it apart but also to crowd it against one side of the reel or sheave, causing undue wear on the sewing wire and outside strands.

Second—Have the rope of the proper width for reel; about one-twelfth of the width of the rope is as much play as should ever be allowed, less might in some cases be better.

Third—See that the reel arms or rim are very smooth and have no sharp edges, if necessary file them until they are so; it will pay.

Fourth—Wind the rope on the reel under a good strain, so that it will be even and solid. This is especially important when there is considerable unused cable left on the reel when the cage is at the bottom. In this case it is a good plan to lower the cage to the bottom of the shaft and unwind all but one or two turns from the reel, at the same time folding the slack back and forth on the bottom level, then by slowly winding it up again the weight of the rope will give sufficient tension so that all of the rope will have a firm and true running center to wind on.

Fifth—Prevent as far as possible any side swinging of the cable as it winds on the reel. If the distance between the reel and sheave wheel is more than 50 or 60 feet it is apt to acquire a considerable swinging movement allowing the rope to be injured by contact with rim or arms of the reel. To avoid this action it is well to provide a pair of carrier or idler pulleys, one set above and one below the rope, and about midway between the reel and sheave wheel. A set of such idlers which are running and giving good satisfaction at one mine in this district (Cripple Creek) are 20 inches diameter, 10-inch face, of cast iron; pulleys are webbed with rim not less than $\frac{3}{4}$ inch thick, are turned straight on face and carefully balanced. The shafts which are keyed to the pulleys are 2 inches diameter and 26 inches long, and run in post boxes which are set in a rigid frame. In some cases it might be advisable to provide for a vertical

Working an Inland Dredger, Oroville, Cal.

mechanical operation. It does not follow that by simply hoisting and lowering the ladder you are getting all you can out of the machine.

Some men lower their ladder several feet, and, if the ground is caving well, just let their buckets drag through the dirt, and do not make another move until the buckets are empty, and then bury them again. Other men lower their ladder and are content to see bucket after bucket come up empty, and when asked why they are not full answer, "The ground is too hard."

Now, these men are no winchmen. A good winchman works as much with his head as his hands. In

delivery plate as possible, and so catching a very large percentage. This, however, is not always feasible, and to overcome the difficulty have a slip chute made which will fit inside the delivery plate and hang it so that you draw it in or out, to or from your bucket, and be able to clamp it in any position. Suppose that you can only get down 8 feet with your ladder. Your buckets will be some distance from your delivery plate. In that case slide the slip chute out till it is just clear of your bucket lips and clamp it. Now work your entire face at the 8-foot level. You raise the ladder if necessary, but never lower it beyond the depth at which you set the chute, or you

Dredger, With Pile of Tailings, Oroville, Cal.

good caving ground he has his ladder on the move constantly, always buried enough to get a full bucket of dirt, and not too deep to make the buckets drag. As soon as he sees the ground cave he begins to raise his ladder immediately, so as not to get his buckets buried too deep.

A full bucket of dirt is all that is required—to get more is an impossibility, a great wear and tear and waste of power.

In hard ground the winchman has to work for a bucketful, and if he cannot work the ground from the top he should let the dredger back and come up on the ground along the bedrock. This will enable him to break the ground, cause it to cave more or less, and so get a run of full buckets. So, in working hard ground and clay, once having got to bedrock keep there, or as close to it as possible, and work your ground from the bottom upwards.

All ground is worked to the best advantage from

will break it. It is a good plan to mark the depth along the well hole every 2 feet, and place some movable article at the depth at which you set each slip chute. There is then little danger of lowering your ladder beyond it, for as soon as the chafing beam of the ladder comes up to it you must go no farther.

When you put your chute into another level set your mark at that level on the deck, and so on. A stream of water playing on the delivery plate is a great help in keeping it clear of sand. When you have worked right across the face slide the slip chute in sufficiently to allow you to lower your ladder say 2 feet, and clamp it there.

Now work your entire face to the 10-foot level; repeat this till bedrock is reached.

No hard and fast rules can be laid down in regard to how much to move the chute. A man must use his judgment and adapt this means to circumstances.

If there is a large quantity of top soil or sand which will not deliver freely, with good gravel underneath,

*The first part of this article appeared in the issue of Dec. 22, 1900.

movement of the idler frame to accommodate it to the changing position of the rope, but ordinarily it is best to have them rigid, as the strain due to deflecting the rope 2 or 3 degrees is not severe on the journals.

Sixth—Remember that the first starting of a new rope calls for the greatest care and attention. The strain on the strands is never quite equally divided and it requires time and actual service to work out these unequal strains. If it happens that a rope soon after being put in service shows signs of failure, such as a tendency to twist or in any way to be distorted, it is a sure indication that something is wrong, and more, it will never correct itself. The conditions affecting that particular part of the rope must be changed. Changing ends or reversing the rope will allow the strains to work out or be distributed so as to do no harm, and in most cases effect a cure. There seems to be a marked tendency for trouble in a new flat rope to develop at a point where the rope leaves the reel when the cage is at the bottom, as in both starting and stopping the shock is apt to be greatest at that point. However, with a little care and treatment as suggested, there should be no more trouble in that respect, as when the rope has once been properly stretched it is good for years of hard work if properly treated in other respects.

Seventh—Avoid as far as possible the use of clamps or rope marks that cover any portion of the rope and interfere with ready inspection of it. In one instance, at one of the prominent western mines, an apparently perfect $\frac{1}{2}$ -inch flat rope broke at a point about 50 feet above the cage where a piece of canvas was sewed on as a mark. The canvas had protected the rope from the lubricating compound but not from the mine water, and the rope entirely rusted through. Fortunately the lesson was cheap as there was no one on the cage.

Eighth—The proper lubrication of a wire rope is of the greatest importance, serving, as it does, the double purpose of preventing wear and a protection from rust. In selecting the lubricating material avoid any compound that will tend to dry or cake on the surface of the rope or that is loaded with solid ingredients that tend to separate from the more fluid portions. The use of drying oil is, I think, never satisfactory, as in time it becomes hard, cracks and allows water to get behind it and prevents any ready inspection of the rope. In my experience a heavy petroleum oil, that is prepared with special reference to resisting the action of water and having no acid in its composition gives the best satisfaction.

In this district the most of the mines using flat ropes employ the arrangement shown here, and which was illustrated on page 2 of the issue of December 22. The oil is heated until perfectly fluid and placed in the can. The air hose is connected, and a fine spray is thrown into the rope as it is lowered between the jets. The application of the oil with this arrangement is very thorough, only takes a few minutes and involves no labor to speak of.

The New Risdon Ship Building Plant.

At the Potrero, San Francisco, several hundred men are at work getting the new plant of the Risdon Company in shape for ship-building. Pile drivers are at work building wharves, steam shovels and excavators grading and filling in, and buildings going up over a part of the forty acres of ground owned by the company. The ship joiners' shop is completed and in operation, furnishing work to a number of men. The shop is entirely run by electricity and is equipped with modern wood-working tools. The excavation for the new machine shop required the removal of about 20,000 cubic yards of rock, used in filling in the new ship ways. The machine shop is 300x100 feet, 40 feet in the clear under the overhead traveling crane. Several electric traveling cranes are in storage waiting the erection of the various buildings. The foundry building is about completed and ranks among the largest in the country. The boiler shop is another large building, with a 60-ton overhead traveling crane. The old wharves are being replaced and piles being driven so that large ships can lie alongside the wharves for repairs. The company, although not in shape as yet to execute any large ship-building orders, has contracts for two small boats, one a twin screw boat for the Alaska trade, the other a cargo boat for the Hawaiian trade. This company has also several contracts for gold dredging machinery, a line of business of which they make a specialty. To show how far reaching the demand for successful mining machinery is, may be mentioned that this company is now erecting a large gold dredging plant in Ashanti, on the Gold Coast of South Africa. The machinery for this equipment filled ten cars and was carried through by special train from San Francisco to New York direct. The new electric hoists for the Comstock, six of which are now building at the Risdon shops, are expected to revolutionize mine hoisting there.

Union Iron Works' New Building.

The Union Iron Works of San Francisco will put up a \$60,000 building, southeast corner Second and Folsom streets, frontage 100 feet, depth 50 feet,

three stories, for the mining machinery department. On the ground floor will be the offices and the show rooms; on the second floor, the drafting department and the pattern shop; the pattern storage room will be in the upper story. In the rear, on Folsom street, will be the machine shop, 100x150 feet, rising 43 feet and surrounded by a gallery 25 feet in width. The building will be of steel and corrugated iron.

Methods of Mining on the Mother Lode, Cal.*

A policy which obtains throughout the mining districts of California is that of demanding prompt returns from ore development, which is of course very desirable, but which in many cases works ultimately to the disadvantage of the owner, and the manager or superintendent is so completely handicapped that he is unable to make substantial headway. There are certain districts where this demand for "immediate returns" does not act so disadvantageously, but in the mines of the Central Lode it is undoubtedly a short-sighted policy. The reason for this will become apparent when it is understood that with few exceptions the ground is heavy—often swelling and crushing the heaviest timbers. The usual practice is to drive a crosscut or drift from a station at the shaft to the vein. This may or may not at once encounter ore; if not, a drift is driven along the fissure, which must be timbered in the most substantial manner. These drifts are usually not less than 7 feet high, 4 to 5 feet wide at the top, and 7 to 8 feet at the bottom. These dimensions are all inside the timbers. It usually makes little difference whether the cutting is in ore or not, the ground is generally heavy. The fissures are often from 10 to 40 feet wide, and the miners (of Amador county particularly) are well acquainted with the danger, difficulty and expense attending this kind of mining. As soon as pay rock is encountered it is hoisted and sent to the mill, and the drift continues, while overhead stopes are started and development proceeds. It may be several hundred feet to the limit of the property, and is often

footwall, should have crosscuts extending at right angles to the direction of the main gangway. These should be disposed at stated intervals for the purpose of prospecting the fissure and to render accessible the ore discovered. In slate, the main gangways should be at a distance of 40 to 60 feet from the vein—where in greenstone they may be driven nearer the vein. The crosscuts should be driven at stated intervals, a greater or less distance apart according to the character of the ground adjacent to the vein. When the ground is very bad, the crosscuts should be closer, and when less so, at longer intervals. In most cases, if driven at intervals of 240 feet, the distance will be found convenient. Raises should always be put through, connecting with the level above, before stoping is commenced. Very often this important matter is neglected, owing, as previously stated, to a desire to realize a profit on the ore as quickly as possible. These raises should be put in about 60 feet apart; this, beginning 30 feet from the point where the crosscut reaches the vein, will admit of four raises within the 240-foot section suggested, the vein being worked 30 feet each side of the raise.

When putting through raises, it is really an economical plan to sink a winze from the level above to meet the raise. By this means ventilation will be more quickly obtained, and the additional work which men can accomplish will soon pay for the increased cost of sinking the winze. Men will not and cannot perform the best work most expeditiously in a foul atmosphere, though the fact seems to be lost sight of by many mine owners.

In addition to the great disadvantage of foul air, when the raises are not put through, the heavy timbers must be hoisted through the raise into the stopes by means of block and tackle at great expense of time. If the raises were through, the cost of handling these great timbers would be very materially reduced by lowering them through the raise from the level above to the floor of the stope where they are to be placed in position.

With the lateral drifts and crosscuts completed, and drifts driven on the vein, with raises through to the next level above, the work of stoping can be carried on at as many points as may be desired, and in a few weeks, or months at most, the greater portion of the excavation made on the vein, where not filled, will collapse and be closed up forever. This works no harm or inconvenience, as the main lateral drift remains open.

When operating in this manner, filling for the stopes may be taken from the hanging wall by driving an inclined raise into it and opening out a chamber. The rock broken in these chambers will pass by gravity down into the stopes beneath and fill them, little or no shoveling being necessary. This method of mining and filling, when properly carried out, will prove safe and far less expensive than some of the methods heretofore employed in California mines. In some mines, if stoping be expeditiously prosecuted in the manner above suggested, no filling will be required, the timbers affording all the support necessary, but in most cases filling of the stopes is advised. Where the hanging wall country adjacent to the vein has a tendency to cave, it may be that the inclined upraise for the purpose of obtaining filling for the stopes may be inexpedient. In that case, a horizontal crosscut may be driven to the solid ground of the hanging, that portion nearest the vein being securely timbered. The filling must then be distributed by means of wheelbarrows.

These filling chambers may be worked with hand or power drills, large or small, as seems desirable. One of the greatest items of mining expense, as now practiced, is that of constantly relieving swelling or running ground, and retimbering. When the ore shoot is attacked in sections by crosscuts from the lateral drift, any particular section need remain open only a few months at most, instead of two, three or more years, as now.

Another advantage may be derived by driving an intermediate level midway between the main levels, if the ground is particularly bad, and connecting with the crosscut or gangway beneath by a raise. In this manner the floor of the lower main level need only be maintained about half the time that would be necessary if all ore were sent down to the main level through a mill hole extending upward 100 feet more or less, and connecting two main levels. The plan would, of necessity, require that a raise be cut through solid rock from the vicinity of the main gangway to the footwall of the vein, reaching it about midway between two levels. Each of these raises would have an approximate height of 40 to 60 feet, and would cost, perhaps, when timbered, \$500; but the expense of keeping open the level in the vein would soon offset this expense if the ground were very bad.

As a matter of course, the superintendent must determine when an intermediate level and auxiliary raise are justifiable. His experience with the ground in the fissure will dictate whether the plan suggested is advisable or not. The sketch on this page illustrates the idea.

Method of Working Veins in Swelling Ground.

over 1000 feet, and this heavy swelling—sometimes running—ground must be kept open until the entire level has been explored and the ore to the level above all extracted and sent to the surface. An idea of the character of some of this ground may be gained from the statement that in a certain instance a drift of usual size being driven a distance of 200 feet, at the rate of 5 feet or more daily, under contract, could not be completed before it became necessary to return to that portion first driven for the purpose of retimbering. The timbers employed in holding ground of this character are usually 20 to 30 inches in diameter, and it is no uncommon thing to see these immense logs, a few weeks after being put in place, split, crushed and broken as though they were incapable of offering any resistance to this all but irresistible force.

The advisability of cutting the main gangways in the hard rock of the walls, either foot or hanging, and reaching the vein by a system of crosscuts, is advised. This has not as yet, at this writing, been attempted, but its feasibility and desirability can readily be appreciated when the character of the main fissure, as above explained, is understood.

These main gangways, being driven in, say the

High-Pressure Rotary Pumps.

Written for the MINING AND SCIENTIFIC PRESS by
JNO. RICHARDS.

"There has been a great deal of effort expended in attempts to invent pumping machines of a durable and efficient kind that would have continuous action and produce a constant flow of fluids. The incentives

feet) and to even greater heads. In one case, at Geneva, 5000 gallons per minute are raised 140 meters (460 feet) with an efficiency of 71% to 72% in water raised, including the losses of the electric motor that drives the pump. An illustration of this is shown in Fig. 1 of the drawings.

The writer of this in 1896 discovered the nature and scope of the resistances that caused a limit of head

tempts were made to determine the discovery in practice until the achievement of Messrs. Sulzer Bros. in Switzerland during the past year again brought up this subject.

High-pressure rotative pumps, with nearly all the features of the centrifugal type and operating at a high efficiency, are therefore an accomplished fact. They act by a combination of forces and demand a high grade of workmanship compared to pumps for low pressure. The power applied all appears in water raised, less a minimum of working losses common to pumps of all kinds.

The characteristics of these pumps are: Their original cost for a given duty does not exceed one-third as much as for piston pumps. The space occupied is not more than one-fourth as much, and as there is no jar or vibration, foundations are inex-

Fig. 1.—Four Stage High Pressure Pump: Sulzer Bros., Winterthur, Switzerland.

for such effort are many. The weight and cost of pumping machinery of any kind is inversely as the speed at which the fluid passes through it; or in other words, inversely as the volume raised or impelled in a given time. The difference between rotary and reciprocating pumps in this respect is about as five to one. For low pressures and large volumes centrifugal machinery has to a great extent displaced positive or piston machines for fluids of all kinds, but there has been a limitation of pressure that confined pumps of this kind to low heads, and for liquids, to a pressure not exceeding forty pounds per inch. The reasons for this are obscure, and have greatly puzzled scientific people for thirty years past.

Twenty years ago, Emile Bourdon, a celebrated French engineer, produced by centrifugal force combined with impact and tangential energy, water pressure exceeding 1000 pounds per inch, but was by constructive and operative difficulties unable to produce practical machines. Since his experiments it has been well established theoretically, in so far as the kinetic conditions, that there should be no practical limit to the pressure or head against which rotary pumps can operate. Bourdon, Unwin, Rankin, Prof. Reynolds and others have established this mathematically, but were unable to discover the cause of certain cumulative resistances in centrifugal pumping that consumed power without corresponding useful effect. The energy applied to pumps disappeared in some mysterious way; but, strange to say, no one searched for it in the form of heat imparted to the water, and like many other problems of the kind, it was left to be worked out by practical experiments of constructive engineers.

During the past year a practical solution of this subject has been reached by Messrs. Sulzer Bros. of Winterthur, Switzerland, in a works where of all others such a discovery would be most expected. Messrs. Sulzer Bros. stand at this day in the first rank among scientific constructing engineers. For more than twenty years past the firm have given more or less study to rotative pumping machinery, and lately have made this branch a subject of special study and experiment in their works, resulting in more than a dozen installations of free running rotative machines for raising water up to 160 meters (520

Fig. 4.—Two Stage or Compound Pump.

or pressure in centrifugal pumping and devised a means of evading such losses. Communications and sketches of a proposed solution of this impediment were at the time sent to Prof. John E. Sweet, at Syracuse, New York, and to Mr. Charles Brown, C. E., of Basel, Switzerland; but no practical at-

tensive. There is no running contact of the parts, except the spindle bearings, consequently no wear or expense of maintenance, as in piston pumping machinery. There are no valves, no stoppage or reversal of parts, and the flow of water through the pumps is four to six times as rapid as in piston pumps. They are directly adapted for connecting to high-speed motors and engines, consequently dispensing with the usual gearing required to operate crank driven pumps.

Such pumps do not belong in the same class with the common centrifugal type adapted for low pressure; their manner of operating is different, and the construction must be of a much higher grade to withstand their greater speed and pressure.

Pumps of this type are now being made to consume 1000 H. P. and to raise water 800 feet at a pressure of 344 pounds per inch. It is a "revelation," also is a "revolution" in the manner of raising and impelling fluids.

Head of Water and Miners' Inches.

The following table tells how many miners' inches of water are required to have a certain head of water for a certain size nozzle:

Head feet.	Miners' Inches.				
	2-in. nozzle.	2½-in.	3-in.	4-in.	5-in.
100	80	125	185	325	500
150	100	155	225	400	625
200	115	180	260	460	715
250	130	200	290	515	800
300	140	220	320	565	880
350	150	240	345	610	950
400	160	255	365	650	1,000

Kindly Colorado Comment.

For the benefit of those who at the beginning of the new year may contemplate subscribing for a scientific mining paper, the Journal will announce that the MINING AND SCIENTIFIC PRESS, of San Francisco, is without a peer among the journals of this class; in other words the best in the world, not the "better." —Telluride, Colo., Journal, Dec. 29, 1900.

Mining and Metallurgical Patents.

Patents Issued January 1, 1901.

WELL DRILLING MACHINERY.—No. 665,026; G. D. Loomis, Tiffin, Ohio.

Frame including derrick, drill rope passed over pulley, adapted for operative connection with spudding beam pivoted in frame, second beam having fixed relation to spudding beam, rotatable body engaging second beam, adapted to move longitudinally thereof to raise and lower it with varying speeds, pivoted walking beam adapted for operative connection at one side of its pivot with drill rope and at opposite side of its pivot with second beam alternately with operative connection of drill rope with spudding beam, whereby spudding or drilling may be performed with quick down motion and slower up motion without changing direction of rotation of mechanism.

MINER'S CANDLESTICK.—No. 665,067; E. J. Troughton, Victor, Colo.

In miners' candlesticks, chimney support consisting of tubular body, apertured horizontal flange at upper portion, rings formed upon upper portion of flange, connected with upper ends of strips, outer ring of upper set having slot formed in lower edge, outer ring of lower set having similar vertically aligning slot in upper edge, transparent sheet of fireproof material passed through slots into spaces between upper and lower rings of chimney support.

PROCESS OF EXTRACTING GOLD AND SILVER FROM ORES.—No. 665,105; J. C. Kessler, Milwaukee, Wis.

Process of separating precious metals from auriferous and argentiferous ores, consisting, first, in subjecting ores to action of an aqueous solution, consisting of cyanide of alkali metal, yellow prussiate of potassium and permanganate of an alkali metal in proportion of water, one thousand parts; yellow prussiate of potassium, two and one-half parts; cyanide of alkali, two and one-half parts; permanganate of potassium, one-tenth part until gold and silver contained in ores are dissolved; second, separating metals from their solution by application of soluble lead salt, by which cyanide solution is decomposed and non-soluble cyanide of lead is formed, at same time non-soluble cyanide of gold or silver is precipitated; third, by application, to sediment thus precipitated, of sodium amalgam, whereby gold, silver and lead amalgam is produced and concentrated solution of cyanide and ferrocyanide of sodium regenerated; fourth, diluting concentrated cyanide solution with water, regenerating and re-energizing aqueous solution for reuse by addition of permanganate of alkali.

SCREW CONVEYOR.—No. 665,262; S. B. Peck, Chicago, Ill., assignor to Link Belt Machinery Co., same place.

Screw conveying device, combination of containing box normally in horizontal position for conveyance of gritty substances, shaft in containing box, screw blade upon and about shaft, longitudinally split cylindrical-like enlargement removably, but normally

rigidly, attached to and surrounding shaft so as to rotate therewith, longitudinally split tube-like bearing part into which cylindrical part fits, support removably attached to top of containing box and connected with tube-like bearing part so as to hold same in position, outer face of cylindrical part snugly fitting inner face of tubular part substantially throughout their lengths, so as to present extended bearing surfaces and to prevent gritty material in which bearing is embedded from entering between these parts.

MINING MACHINE.—No. 665,183; F. J. Crane, Cripple Creek, Colo.

Combination with water tank, of cylinder occupying inclined position in relation to tank and into which it extends at its lower end, cylinder having inwardly projecting flange at lower end, screw within cylinder extending from flange to upper end of cylinder, shorter screw at lower end of cylinder terminating within flight of former screw, screws having perforations therein in parallelism to axis of cylinder, shaft to which cylinder is connected and means for rotating shaft.

ORE GRANULATOR AND PULVERIZER.—No. 665,339; J. M. Montgomery, Butte, Mont.

In ore granulator and pulverizer combination with annular casing, of rotatable head provided with lugs, diagonally disposed bearing boxes adjustably secured to lugs, pusher wheels journaled in boxes, sphere located in casing and adapted to be engaged by pusher wheels and by them chased around casing.

HAND DRILLING MACHINE FOR DRILLING STONE.—No. 665,364; C. M. Engstrom, Ossipee, N. H.

In rock drilling machine, combination with series of hammer helves pivotally mounted, and provided at one end with hammers, of toothed wheels to operate hammers, series of drills having spiral projections on their shanks, surfaces of projections being inclined relatively to axes of drills, series of arms pivoted to hammer helves, their lower ends lying under projections and engaging their lower faces as hammers are raised, whereby drills are partly turned, inclination of spiral projections preventing operative engagement of arms with their upper faces on downward stroke of hammers.

LINING FOR CRUCIBLES.—No. 665,254; W. A. McAdams, New York, N. Y.

A crucible lining composed of powdered fused oxide of manganese and oxide of copper as a binder.

Banka Tin Mines.

On the small islands of Banka and Billiton, east of the southern end of Sumatra, portion of the Dutch possessions, the tin deposits are tested by systematic boring, the sands obtained in these operations being washed and their richness in tinstone determined. Their value thus proved, the tin fields are let to Chinese capitalists on conditions determined by the results obtained in the boring tests. In Banka, the average depth of the pay gravel is 3 feet, and that of the overlying overburden about 30 feet. On the average, a cubic yard of excavation produces about 3.5 pounds of metallic tin. The mines are controlled and largely owned by the Dutch Government. The tin mining is in hands of Chinese, who work the mines, wash the pay gravel and smelt the clean ore in small cylindrical clay furnaces. The tin is sent to Batavia,

and thence to Holland, where it is sold by auction. The greatest part of the tin is produced under the auspices of the Billiton Co., which tests the tin lands, and then sublets it to Chinese miners, the Billiton Co. paying the Dutch Government five-eighths of the net profit as royalty.

On the island of Singkep, in the Lingga archipelago, close to Billiton, the deposits are exploited by a Dutch tin mining company, but the actual mining and smelting are in the hands of the Chinese. Since 1897 the tinstone is not smelted in Singkep, but is sent over to Singapore to be smelted by the Straits Trading Co. In Sumatra there are several tin-bearing regions.

The cost of tin production in the island of Banka has averaged about 34 florins per pikul (133.33 lbs.) of tin delivered in store at Java—about \$164 per ton—its cost to the Government, exclusive of duty or taxes. At Billiton the cost of tin delivered in Holland, inclusive of the dues paid to the Dutch Government, is about \$245.

Notebooks in Underground Work.

Written for the MINING AND SCIENTIFIC PRESS by AUDLEY H. STOW.

Copying notes will usually, in time, be found rather monotonous, as well as expensive, where time has any cash value; a separate notebook or number of pages for each entry, cross entry, level or other working, while a most excellent system where applicable, is still not adapted to many cases, especially extensive workings being rapidly developed, when the entering of the notes, consecutively, in the order in which the surveys are made, becomes imperative.

Hunting up the last notes for any particular place, however, usually consumes time, owing in part to the bad light, the smudge on the pages and the illegibility of notes written in semi-darkness, and often in cramped position. In platting such notes the same difficulty recurs, to a lesser degree. If, however, after returning from work, the names of each particular working be entered, roughly, in indelible red ink, it will be found a grateful relief to the eyes, in the dim, flickering light underground, while saving time—and profanity—and is of nearly equal assistance in plotting. In the cases of rooms off an entry, the number of each may be endorsed in a circle, so that the eye will readily run over widely scattered notes. For instance:

Burns (in red ink)

Sponge rubber will be found to remove much the larger part of the smudge from the page, without erasing the notes appreciably—provided a sufficiently hard pencil is used—and will sometimes bring out notes plainly which can not otherwise be deciphered.

Triumph Feeder.

The accompanying cut represents the Triumph feeder, manufactured by C. O. Bartlett & Co., Cleveland, Ohio, in three sizes. They claim that it will feed even and regular at all times, and nearly all kinds of material, such as coal, sand, crushed stone, all kinds of ore, sawdust, salt, concentrates, quartz,

phosphates, fertilizers, gypsum, brewers' grain, and all kinds of grain and feed; in fact, will feed any material excepting sticky or adhesive product. The feeder can be regulated to feed slower or faster while in operation, and when set so as to feed a required amount, will do so without variation.

UNITED STATES CONSUL THORNWELL HAYNES, at Rouen, France, says: "Circulars printed in English are a waste of time and money. Circulars come to this office giving the analysis of gas coal, etc. What does a man who talks, writes, speaks and thinks in French know about 'volatile matter' or 'fixed carbon' or 'ash'? A ton of 2240 pounds is as indefinite to a Frenchman as the word 'some' is to an American. Quotations, to receive attention, must be put in French weights and money in the French language."

THE yearly coinage statement of the Director of the Mint shows that the total coinage of the mints of the United States was \$137,599,401, as follows: Gold, \$99,277,942; silver, \$36,295,321; minor coins, \$2,031,138. Of the silver coined \$24,960,912 was in standard dollars. The December coinage amounted to \$7,758,580, of which \$4,576,697 was gold and \$2,288,555 silver and \$301,328 minor coins.

Seventh Annual Review of the Lake Superior Copper Industry.*

(Copyright, 1900, by HORACE J. STEVENS)

The year 1900 has been the most prosperous ever known in the Lake Superior copper industry. The production of metal has been practically the same as last year; but earnings have been larger, owing to the maintenance of a uniformly high price for the product of the mines. The number of men employed in the mines was never so great as during 1900, and wages are higher than for a generation past. More millions have been spent in betterments than have ever been so invested in any single twelvemonth before, and the prosperity of the mines has not been confined to the shareholders, but has been generously divided with labor.

The Keweenaw copper-bearing beds of igneous rock stretch from the eastern end of Keweenaw Point, through northern Wisconsin into Minnesota, but the portion of this territory in which active mining is now in progress is about 80 miles in length—from the Washington mine, on the east, to the Victoria mine, lying just west of the Ontonagon river. The eastern end of the active district is in Keweenaw county, and the western portion in Ontonagon county, but the central and more important part of the district is in Houghton county. The growth of mining in Houghton county, the heart of the Lake Superior copper district, is best shown by the following official figures from the annual censuses of mine employes, taken in September of each year, by Capt. Josiah Hall, county mine inspector:

Year.	Number Em- ployes.	Number Fatal Accidents.
1889	6,480	21
1890	7,310	25
1891	7,702	28
1892	7,640	21
1893	7,591	23
1894	7,348	22
1895	7,249	46
1896	8,170	19
1897	8,726	26
1898	10,469	23
1899	13,051	27
1900	13,971	25

The great increase in forces employed is due partly to the opening of new mines and partly to a great increase in the number of men employed by nearly all of the regularly producing mines. The Calumet & Hecla had nearly 7000 men in its employment during the summer of 1900, and proportionate increases have been made by the Tamarack, Quincy, Atlantic and other old mines.

The production of refined copper by Lake Superior mines has been as follows for the past four years:

Year.	Pounds Ingot Copper.
1896	142,057,500
1897	142,702,586
1898	147,965,738
1899	146,950,338

These figures show a falling off of 1,015,400 pounds in 1899. The production of 1900 will not be officially known until the middle of next year, but will show very little change from 1899, with, perhaps, more likelihood of a slight decrease than of an increase. The lack of increase in production, notwithstanding the vast amount of new work under way for the past two years, may appear strange without an explanation. There is no other mining field in the world where so much money and so great a length of time is required for the opening of a new mine as in this district. The experience of the opening of a new mine has shown that three years' time and a half million dollars in cash are the minimum requirements for developing new properties into producing mines. Despite its importance as one of the four mining districts which together supply four-fifths of the world's copper, the Lake Superior field is essentially a low-grade district. The richest mine here—the Calumet & Hecla—carries a trifle less than 34% ingot copper in its rock, while the Atlantic, at the other end of the list, has paid profits crowding the million mark from rock returning an average of only two-thirds to three-fourths of 1% ingot. The great production and enormous profits of the Lake copper mines are rendered possible only by the existence of regular stratified copper-bearing beds of great width, enormous length, and depth so great that the internal heat of the earth will check the miners long before they have reached the end of paying ground. The development of such metalliferous deposits requires princely fortunes for each new mine, and it will be nearly two years before the influence of the outputs of the new mines is plainly apparent in the figures of production of the district as a whole.

Of the 1900 output of copper, the following-named mines have furnished approximately these quantities:

Mine.	Pounds Ingot Copper.
Calumet & Hecla	85,000,000
Tamarack	20,000,000
Quincy	15,000,000

*Condensed.

Osceola	12,000,000
Atlantic	5,000,000
Wolverine	5,000,000
Franklin	4,000,000
Baltic	2,000,000

The Calumet & Hecla has recently stopped work at four of its five shafts on the Osceola amygdaloid. This suspension is due to inability to secure delivery of machinery when promised and lack of milling facilities to treat rock from these shafts before the completion of the new amygdaloid mill at Lake Linden. It is not likely that much work will be done at these shafts before 1902. Work at the Calumet & Hecla proper, on the conglomerate, continues with unabated vigor.

The Tamarack has just bottomed its No. 5 shaft—the greatest undertaking of the sort ever begun. When the first sod was turned for this shaft, on Aug. 7, 1895, Capt. W. E. Parnall, superintendent of the mine, stated that he expected to cut the Calumet conglomerate about Jan. 1, 1901, at a depth of, approximately, 4665 feet. The lode was cut on Dec. 20, 1900, at a depth of 4657 feet—eleven days sooner and at 8 feet less depth than Capt. Parnall's estimate. As there were no diamond drill borings and the shaft was sunk in virgin ground, the exact verification of the preliminary estimates of time and depth are certainly remarkable. The shaft will eventually add about 50% to the productive capacity of the mine, but will not be in full commission until well toward the end of 1901.

The dividend disbursements of Lake Superior copper mines for the past ten years have been as follows:

Year.	Dividends.
1891	\$3,540,000
1892	3,260,000
1893	3,520,000
1894	2,380,000
1895	3,280,000
1896	3,985,000
1897	5,431,000
1898	6,853,000
1899	12,318,000
1900	9,798,000

In explanation of the decrease in dividends for 1900 from the high-water figures of the preceding year, it should be stated that the Calumet & Hecla paid dividends of \$10,000,000 in the calendar year 1899, though only \$8,000,000 has ever been paid by the company during any of its fiscal years, and the dividends of that company for 1900 are \$1,000,000 less than they would have been but for a disastrous fire in the mine last May. The dividend disbursements of 1900 by Lake copper mines other than the Calumet & Hecla are much the largest ever known.

The profits returned to shareholders by the copper mines of Lake Superior, to the close of the nineteenth century, have been as follows:

Mine.	Dividends.
Atlantic	\$860,000
Cliff	2,518,620
Central	1,970,000
Copper Falls	100,000
Calumet & Hecla	72,850,000
Franklin	1,240,000
Minnesota	1,820,000
National	320,000
Osceola (including Kearsarge)	3,812,500
Pewabic	1,000,000
Phoenix	20,000
Quincy	12,320,000
Ridge	100,000
Tamarack	7,290,000
Wolverine	510,000
Total	\$106,731,120

This is a showing equaled by few mining fields in the world. Of the total profits returned to shareholders, the Calumet & Hecla has furnished 68%, the Quincy 11% and the Tamarack 7%. These three mines have made almost 87% of the total profits disbursed by Lake copper mines.

Estimating the market value of the 1900 production of Lake copper at \$25,000,000, which is a close approximation to the actual figures, the Lake mines have produced copper during the nineteenth century to the value of \$414,117,304. The dividends from this production amount to a fraction more than 25% of the gross value of the output.

The twenty-eight leading copper mining companies of the district had 20,984 shareholders of record on Dec. 31, 1899, the Calumet & Hecla leading with more than 3000 stockholders.

Based on the closing quotations of the Boston Stock Exchange, on Saturday, Dec. 22, 1900—the last session before the Christmas holidays—the market value of the twenty-five leading mining properties of the Lake district was as follows:

Mine.	Market Value.
Adventure	\$1,050,000
Allouez	250,000
Arcadian	3,225,000
Arnold	450,000
Atlantic	1,100,000
Baltic	3,100,000
Calumet & Hecla	81,500,000
Centennial	2,150,000
Elm River	550,000
Franklin	1,500,000
Isle Royale	5,700,000
Massachusetts Con.	1,350,000
Michigan	500,000

Mohawk	2,350,000
Mayflower	200,000
Old Colony	387,500
Osceola	7,350,000
Quincy	17,400,000
Rhode Island	400,000
Tamarack	19,620,000
Trimountain	2,000,000
Victoria	350,000
Winona	425,000
Wolverine	2,745,000
Wyandot	150,000

Total.....\$155,802,500

A Suggested Method.

TO THE EDITOR:—I have the following to offer as a possible solution of the problem mentioned in your issue of Nov. 17th, and will add that I have tried this scheme in a small way with good success. I also suggest, before going to any considerable expense, that some experiments in a small way can be made at small cost and the scheme given a test. Not knowing capacity of the mill, I will say that, supposing it to be a 50-ton mill, I would put in eight wooden tanks, 24 feet diameter, 7 feet high, in two rows of four tanks each, below the mill. The first row next the mill fit up with the usual filter bottom used in a cyanide plant, and on top of the filter put in 2-inch gaspipes about 12 inches apart; bore $\frac{1}{8}$ -inch holes in these pipes 3 inches apart. In the second row fit up as above, with the addition of 1 foot of charcoal, with two thicknesses of cheesecloth on top of the charcoal to hold it in place. To operate this plant bring the tailings in launders to the first row of tanks; fill one tank at a time with tailings and water. When one tank is full, turn tailings into another tank, and on the full tank turn on compressed air at fifteen pounds pressure; also, stream of clear water, say, 1-inch pipe, into bottom of tank under the filter bottom. Allow overflow from near top of tank to go into one of the tanks with the charcoal filter. Open a drain hole at bottom of tank and turn on air. The operation of the air and fresh water in the first tank will bring all the fine mineral out and over into the second tank. The water in second tank is filtered out clear without loss of value, unless some values were in solution in the water. If such is the case, it could not be much, and the charcoal would deposit some of it. The second tank is cleaned up when necessary and the product shipped to smelters. About once in six months it may be advisable to clean out the charcoal and burn it, to recover values, etc. The first four tanks should have the usual dumping hole, in center of tank, and tanks set high enough to allow a car to pass under. An air compressor of 200 cubic feet per minute is needed. By having eight tanks of capacity mentioned, the operation is continuous. Eight wooden tanks and an air compressor of above capacity does not cost much to install. The only drawback to this scheme is that it is not patented.

Boulder, Colo., Jan. 5.

Dryer for Concentrates.

TO THE EDITOR:—A dryer to be used for drying concentrates is in use here, in which the pipes are placed one above the other, with the loops all occurring at the upper end and none at the lower end, in order that the ore may be shovelled more easily to the car immediately below. The floor can either be made of sheet iron or of flooring, with strips of thin iron fastened down to take the wearing of the shovel. The scheme of the dryer is to utilize the exhaust, if possible, from steam machinery, or, if not possible, to use a boiler for steam and to dry the concentrates by piling them around these steam lines. In practice it works very well. Any number of rows of pipe can be laid as desired; but practically there is no necessity of their being over 2 feet from the floor of the dryer. The number of links in a group would be regulated by the amount of concentrates to be dried per day and the number of groups by the time required to accomplish the desired result on each lot. Then the pipe sections would be so arranged as to supply steam to and drain water condensation from these groups, being used for drying, and to allow those not needed to be cut off by valves. Five links will dry fifteen tons of 60-mesh lead concentrates in twelve hours. The lower end of links are secured by U bolts. This dryer is very simple and can be erected by any one who can handle a wrench.

Aspen, Colo., Jan. 4.

In 1880 the establishment of the electric industry in the United States began to be of some importance. Seventy-six firms, employing 1271 persons, were then established. Their output was \$2,655,036. Ten years later the firms increased to 189, and the number of persons employed to 9485, while the output was \$19,114,714. In 1880 there were only three stations in the United States, and only 230 persons were employed at them. In 1890 in New York, the District of Columbia and the city of St. Louis there were 144 electric light and power stations, where 2000 persons were employed, and the output from them was valued at \$4,783,224. Four years later, in 1894, there were 2124 central stations in the United States and 7475 separate plants. In 1900 there were 5000 central stations and over 15,000 separate plants.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALABAMA.

Estimated yield of gold and silver for 1900 is given as \$2500 in gold, and twenty-seven ounces of silver.

ALASKA.

A break in the ledge is reported on the 400-foot level of the Apollo mine, on Unga island, rendering necessary the sinking of a new shaft to strike the ore shoot.

ARIZONA.

COCONINO COUNTY.

The Ohio C. M. & Smelt. Co. is shipping ore from its mines in Grand Canyon, near Flagstaff, to Colorado.

GRAHAM COUNTY.

The new plant at the Medler, near Clifton, will be ready April 30th.—W. R. Thompson, fiscal agent Shannon Cop. Co., says that plans are being prepared for a 150-ton concentrator and for a 100-ton smelter to be built near Clifton.—The foundations for the 200-ton concentrator which will go in at the Longfellow, at Clifton, are nearing completion; the plant will be run by gas engines.

MOJAVE COUNTY.

A body of wolframite is found on the Sandy river, near Signal; the property is bonded to A. J. Doran.

YAVAPAI COUNTY.

On the Henrietta, in Big Bug district, the 20-stamp mill is running steadily; \$100 ore was recently shipped to the smelter.

CALIFORNIA.

AMADOR COUNTY.

More men will be put on at the War Eagle at Plymouth.

After a shut down for over a year the Cooper and Boom mines, in Oleta district, have resumed.—Operations at the Keystone, Sutter Creek, are going ahead satisfactorily.—Supt. W. H. Storms of the Balliol mine is getting things in shape to keep the forty stamps dropping steadily. He contemplates a new shaft. The present one is down 750 feet.—Twenty stamps are dropping at the South Eureka.—The cost of mining, milling, development work, including new vertical shaft and expense of running chlorination works at the Kennedy, at Jackson, is estimated at about \$5 to the ton.

The East Central Eureka M. Co. has sued the Central Eureka M. Co. for \$165,000, the value of ore alleged to have been taken from the plaintiff's mine by the defendant.

The Jackson Con. M. Co., capital \$300,000, is organized to work the Fleming, near Jackson, recently bonded to B. A. Ogden.—The Mitchell, at Pine Grove, idle for thirty years, is being worked by Dr. Decker; L. C. Hyner, Supt.; a shaft is being sunk and a 10-stamp mill running steadily.—It is said that \$8 per day to the man is being taken out at the Christensen (gravel), near Volcano.

The ditch of the Standard Electric Co. will be 20 miles long, 16 miles being ditch and 4 miles flume. It will be 12 feet wide on top, 6 feet wide on the bottom and 4 feet deep. It will have a fall of 220 feet in the 20 miles. The ditch will empty into a reservoir, from which a 3-inch pipe will lead, giving a head of 1485 feet, or 640 pounds pressure to the square inch. The pipe will run through a tunnel $\frac{1}{2}$ mile long and down the bank of the Mokelumne river to White's Bar, the site of the power house. Only 5000 inches will be used for the first year.—Chase & Sons Co. are working the Clinton Bar (gravel), near Jackson.

BUTTE COUNTY.

After an idleness of ten years the Cherokee, near Oroville, has resumed; 2500 feet of 22-inch pipe and 1800 feet of 15-inch pipe are going in, and a 600-foot extension of the flume is under way.

CALAVERAS COUNTY.

A \$700 pocket was recently opened up on the Rising Sun at Robinson's Ferry.

J. Levaggi, who recently bonded the Acme at West Point, will put in a 5-stamp mill to be operated by water power.

R. Shaw, operating the Courier on Clear creek, near Angels, has driven a tunnel on the property.

A strike of a 6-foot vein of rich ore is reported in the Morning Star.—The shaft at the Ophir, at Carson, is down 320 feet, and drifting both ways is in progress on that level; Supt. Miller.

The Melones Co., at Robinson's Ferry, has forty men working.—The Hexter M. Co., at Mokelumne Hill, has sold 3000 acres of mining land, including buildings, mill, water rights, etc., near Stockton hill, to J. McSorley & Co.; mill is being

overhauled and mining operations will begin soon.—C. L. Clark, of San Francisco, leasing the Deep Gulch (quartz), near Mokelumne Hill, has run the tunnel in 115 feet.

COLUSA COUNTY.

The well of the Great Northern Oil Co. at Willows is down over 217 feet; it is expected to strike a strong flow of oil at a depth of 700 feet.

EL DORADO COUNTY.

The restraining dam of the Ralston Divide G. M. Co. at Lynchburg is inspected and pronounced O. K. by the Debris Commissioner, and a permit is granted the company to hydraulic.—A test run was made at the Gopher-Boulder at El Dorado recently and result was sent to owners in San Francisco.

The Emery G. M. Co. has resumed operations on the Gold Hill (gravel), near El Dorado; it is said that \$100,000 have been spent in building reservoirs, ditches, flumes, etc., on the property; the company is sinking a shaft on the Live Oak (quartz); drifting will be started on the 200-foot level.—The Shepherd (gravel) is bonded to the Emery G. M. Co.; work will soon begin.—The Ritter, Supt. M. C. Rigney, will start in the spring; a new mill and other improvements will go in.

FRESNO COUNTY.

The Aetna Oil Co. is putting up a new rig near Coalinga.—No. 3 well of the Confidence is nearing completion. Drilling of No. 4 continues.—The Ajax Oil Co. is drilling its first well on 32, 19-15, and is down about 500 feet.—Drilling on the El Capitan, 31, will begin soon.—The Corona, on 32, is down 600 feet.—The Blue Goose Oil Co. has suspended drilling on its first well after reaching a depth of 2000 feet, owing to excess of water. The company will cut off the water, if possible, and resume drilling.—The Home Oil Co. has completed wells 6 and 7. Drilling will begin on No. 8 in a week or ten days. No. 3 is producing 130 barrels of oil per day.—The Coalinga Oil Co. is drilling its No. 10 well.—The Crescent Oil Co. will resume drilling in its first hole.—The Echo will drill on 28, 20-13, in the Gravel oil district. It will begin with a 11 $\frac{1}{2}$ -inch hole.—The 36 Oil Co. has bought 36, 19-14.—The Roanoke Oil Co. recently bought forty acres in 36, 19-14 from the 36 Co. and will begin drilling soon.—Drilling will soon be resumed by the Santa Clara. A new rig is going up on No. 1, which is down between 1000 and 1100 feet.

KERN COUNTY.

The Exploration Co. has leased the Garlock mill, Randsburg, and is running it on ore from its mine. Twelve men are employed, eight in the mine and four in the mill; Supt. W. Wilkerson. The tunnel is in 525 feet. Hauling of ore from the mine to the mill, a distance of 1 mile, costs 50 per ton.—The last clean-up of the Butte mine at the Red Dog mill, Randsburg, made Jan. 1st, yielded \$4454 from fifty-nine tons, or over \$75 to the ton.

The Sunset Oil Co. will begin drilling near Fullerton soon.—The Hopper Canyon Oil Co. is building a road to its property. It is expected to be completed in thirty days.—In Tom's canyon the St. Louis Oil Co. has a rig up and will begin drilling soon.—Well No. 6 of the Buckhorn Oil & Transportation Co. is down 620 feet.—The Wilson Oil Co.'s No. 1, on 4, 29-28, Bakersfield, was recently pumped for three days and it averaged 500 barrels of oil per day.—The McFadyen has put up a new derrick on 7, 28-28. A rig will soon be put in and drilling begun.—The Lion well, southeast quarter of 12, 11-24, Bakersfield, has no oil-bearing sand. The fifty barrels a day comes entirely from the shale. The oil rock is 200 feet in thickness.—The Karl Brown Oil Co. is drilling on 23, 28-27.—The McKittrick Con. Oil Co. has struck oil in its No. 2 well at McKittrick.—The Hercules is down 880 feet on 2, 29-28, Bakersfield.—The Sturgeon Oil Co. is organized to operate on 25, 28-27, Bakersfield.—De Groot & Book are drilling again on 33, 29-21.—The Clyde Oil Co. will begin drilling on 23, 28-27.—The American Oil Co. is putting in new machinery at Tehachapi.—The Chicago Crude Oil Co., on 30, 28-28, has struck oil in its well.

Over 1500 mineral locations and proofs of labor have been filed in the county recorder's office this month. The county recorder collected as fees in one day \$1500 for filing new petroleum locations.

LOS ANGELES COUNTY.

The Panamint M. Co., capital \$200,000, is incorporated at Los Angeles.—The Organita M. Co., capital \$100,000, is incorporated at same place.

MARIPOSA COUNTY.

The annual meeting of the Merced G. M. Co. will be held at Butte, Mont., Jan. 23.

MONO COUNTY.

Manager E. J. Andrews of the Castle Peak, near Bridgeport, reports good pro-

gress; the air compressor is working satisfactorily.

NEVADA COUNTY.

Near Graniteville, a ledge of ore is opened up on the Erie; J. L. Gluyas, Supt.—Work on the copper mine at Spenceville has begun.

Operations at the Erie, Eureka, are progressing.

The Providence, at Nevada City, recently shipped three carloads sulphurets to the Selby Smelting & Lead Co., San Francisco.

The Pusbeck mine, near You Bet, is yielding good ore and the 15-stamp mill is in operation.—Work on buildings and machinery at the Lecompton, Nevada City, will begin.

ORANGE COUNTY.

The hole of the Capistrano Oil Co. is down 700 feet into hard sandstone.—The Carbon Canyon Oil Co. will sink its hole to a depth of 1500 feet.

PLACER COUNTY.

A. Brown and others have leased the Baltimore, at Forest Hill, and have begun work.—Excavations for the new mill at the Southern Cross (quartz), near Iowa Hill, are completed; ten stamps will go in first, and ten more later; electric power will be used; R. J. Trimble, Supt.—The new tunnel at the Jupiter (gravel), near Iowa Hill, has cut the channel at a point 260 feet in, cutting off over 1500 feet of tunnel which enters channel at another point; eleven men are working under Supt. Calenberg.

Holman & Williams are working property 6 miles northwest of Colfax; the tunnel will cut the ledge at 240 feet; thirty tons of ore recently shipped to the Selby Smelting & Lead Works, San Francisco, returned \$40 to the ton.

PLUMAS COUNTY.

The Hendel-Packer, at La Porte, managed by Packer & Son, is closed down for the winter.—J. H. Thomas has formed a company at La Porte to work the Claybank near there; three shifts are working and a tunnel is being driven.—The new restraining dam in Rabbit creek, near La Porte, being built by C. E. Pike for the La Porte Con. M. Co., is nearly completed.

SHASTA COUNTY.

This week a snowslide on Patterson creek swept away the entire plant of the Sheba M. Co.

SIERRA COUNTY.

A \$1500 nugget was recently found on a claim in Lady's canyon, near Downieville, operated by J. Costa and others.

SISKIYOU COUNTY.

The ledge at the Dewey, in Gazelle district, near Yreka, in places has a width of 120 feet.—The Jilson, in Henley district, is said to have produced over \$600,000 in the last two years.—Ore from the Polar Bear (copper) at Callahans, is reported to run 20% copper, with gold and silver values.—New machinery is ordered for the Last Chance (gravel), Callahans, and a new dredger is contemplated.—The new mill at the McKeene (quartz) is tested and pronounced satisfactory; men are blocking out ore and production will soon be made.—Good progress is reported at the Spangler (gravel), in Humboldt district.—The mill at the North Star (quartz) is running on ore recently extracted.—Hydraulic mining is progressing night and day at the Hull Gulch (gravel), in Quartz Valley district.—Good ore is being taken out of the Morrison-Carlock.—The dredger at the Yreka Creek mines, at Hawkinsville, is temporarily closed down, owing to a scarcity of wood; Supt. Abbott.—A movement is on foot to erect a dredger on McAdams creek.

TRINITY COUNTY.

The new dredger recently built by C. D. Galvin, at Weaverville, was christened the "Undine" Dec. 25, 1900.

TUOLUMNE COUNTY.

The first annual meeting of the reorganized Santa Ysabel G. M. Co. will be held at Pueblo, Colo., Jan. 31, to elect a board of directors and ratify the purchase of the Santa Ysabel G. M. Co. of Wyoming.

The Republican M. Co. has finished its tramway to the Mammoth 10-stamp mill at Sonora, and is hauling ore.

At the Mt. Jefferson, Carters, a shaft is being sunk on Coyote creek for additional water supply; a new pumping plant will go in.

Day & Hunter have bonded the Davies (gravel), 1 mile west of Columbia; they will sink an incline shaft and expect to tap the gravel at a depth of 160 feet; a 4 H. P. engine will go in.—Three shifts are sinking the shaft on the Clío, Jacksonville, now down 300 feet.—The Mohican M. Co., operating the Lillian and North Star mines, on the Tuolumne river, 3 $\frac{1}{2}$ miles above Ward's Ferry, has run the tunnel on the former in 215 feet, and the one on the latter in 132 feet.—The tunnel on the Riverside, near Carters, is in

400 feet; an additional 100 feet will be run; R. B. Zane, owner.—A good cleanup is reported made at the Little Beauty, Carters.—Work will probably be resumed on the Duffield soon. Four feet of good ore are opened up in the north tunnel.

The new 10-stamp mill at the Hope, at Sonora, was started on the 1st inst.—Lane & Hayward will add ten more stamps to the mill at the Densmore, Columbia.

VENTURA COUNTY.

The Whiddon-Double Oil Co. will put two new rigs in on the Brackin tract, near Santa Paula; No. 4 well, now down 265 feet, is producing twenty-five barrels oil per day; No. 3 well produces twenty barrels oil per day.—No. 2 well of the Santa Paula Oil Co., on the Thompson tract, is down 368 feet; it is expected to run twenty-five barrels oil per day.—Lan-dell, Rowan & Newmark have abandoned their No. 1 well at a depth of 1360 feet; No. 2 will be sunk 500 feet below No. 1.—The Piru Oil Co., on the Bishop tract, are down 125 feet.—No. 1 well of the Aguilla Oil Co. is down 110 feet.—The Home Oil Co., on the Hobson tract, has resumed drilling at a depth of 480 feet.—The Gravity Oil Co., in Timber canyon, is down 780 feet in No. 1.—Oil is reported found in No. 1 well of the Ojai Oil Co. at a depth of 900 feet.

COLORADO.

ARAPAHOE COUNTY.

The Denver works of the American Smelting & Refining Co., during 1900, produced 362,191 ounces of gold, 8,859,117 ounces of silver, 615,382 pounds of copper and 43,885 tons of lead.

BOULDER COUNTY.

The output of the mines of the county for 1900 was as follows:

Gold	\$702,321
Silver	95,358
Lead	1,462
Copper	2,678
Tungsten	7,732

Total for 1900	\$809,551
Output for 1899	574,141
Output for 1898	667,328
Output for 1897	568,892

The Moneta M. & M. Co. has work under way on its property near Gold Hill; the tunnel, now in 1000 feet, will be run to the 1200-foot mark, at which point a 4000-foot crosscut will be begun. A. Graves figures ore reserves at 32,307 tons, at \$10 per ton; C. E. Dennig, general manager.—On the B. & M., at Ward, the shaft is down 800 feet; two new shafts are being sunk, and the 40-stamp mill is being remodeled; the new shaft-house is completed and a new hoister is in.—The Welcome G. M. Co., operating the Silent Friend, at Sunnyside, has twenty men working; the shaft is down 700 feet.—T. H. Mack, operating the April Fool No. 2 and the Clara Belle, on El Dorado mountain, in Hick's gulch, has opened up a 12-foot vein of \$15 ore at a point 115 feet in the tunnel on the Clara Belle.—The Elkhorn tunnel, on Four-Mile, above Salina, operated by Omaha men, will be run 3000 feet into Melvina mountain; it is in 2500 feet. Progress is at the rate of 9 feet per day; W. Smith, manager.

CLEAR CREEK COUNTY.

Output of mines of the county for the year 1900 is given at \$3,924,025, as follows:

Gold	\$1,636,000
Silver	1,970,000
Lead	230,000
Copper	85,000
Zinc	3,025

Total

The shaft on the Le Roi at Idaho Springs is down 412 feet.

The Yankee Con. M. & T. Co., operating the Manhattan tunnel at Yankee, has two shifts working; manager, H. I. Seaman.

EAGLE COUNTY.

Mrs. J. E. Dunn has bought the New York, on Battle mountain, near Red Cliff, and will equip it with necessary machinery and develop it.

FREMONT COUNTY.

The new Rocky Mountain smelter at Florence was fired up and began operations on Dec. 31, 1900.

The output of coal oil from the Florence oil fields for the year 1900 was 1,000,000 barrels.—The new smelter at Florence is temporarily closed down.

GILPIN COUNTY.

Estimated gold and silver production of mines of the county for 1900 is as follows:

Gold	\$1,966,060
Silver	202,960

Total

At the Gilpin mill, Black Hawk, the first section of twenty-five stamps is being overhauled to put in new and deeper mortars, each weighing one ton; a greater

saving of values is expected. Manager Key expects to have mill running Feb. 15th.—A strike is reported on the Lillian, on Pewabic mountain, Pewabic-Russell district, near Central City. Ore is said to run \$70 to the ton.—The Colorado-California Shareholding M. & M. Co. will put in two 40 H. P. gasoline engines at the Crown Point and Virginia mines; 25 tons of ore are being taken out daily; 25 men are employed.

The shaft at the Aududdel, Central City, now down 400 feet, will be sunk to the Newhouse tunnel an additional depth of 1500 feet.—Sinking operations are under way at the Grand Army and Gunnell mines; 100 men are employed.—The Denver & New Haven M. Co. is working over twenty men on the Justice in Lake district. A shipment of fifty tons of ore will be made to the Rocky mountain concentrator at Black Hawk; N. Jones of Russell gulch, Supt.

LAKE COUNTY.

The assessed valuation of mining property at Leadville is given as follows:

Mining property.....\$461,310
Improvements.....440,582

Total.....\$901,892

The output of the mines at Leadville for the year 1900 is given as follows:

Gold.....\$2,926,692
Silver.....5,455,008
Lead.....2,984,344
Copper.....732,623
Zinc.....715,016
Manganese.....73,047
Bismuth.....13,000

Total.....\$12,900,000

Production for 1899 was \$9,672,374.

The 1900 output of the American Smelting & Refining Co., at Leadville, is given as follows:

Gold, ounces.....99,044
Silver, ounces.....4,110,202
Copper, pounds.....1,742,813
Lead, tons.....21,866

The shaft on the Ohio, Leadville, is down 230 feet; two additional shafts will be put on.—At the Fryer Hill the shaft is down 138 feet.—Sinking is in progress on the Home Extension and the shaft is down a little over 500 feet.—The shaft on the Highland Chief is down 300 feet.—The Rubie is daily producing twenty tons of sulphide ore, carrying gold, silver and lead; a 400-foot drift will be run to connect the workings of the Yak tunnel.

OURAY COUNTY.

Estimated gold and silver production of the mines of the county for 1900 is as follows:

Gold.....\$1,694,490
Silver.....1,397,862

Total.....\$3,092,802

The old Iron-Silver, at Leadville, produced over 67,000 tons of ore during 1900.—The shaft on the Moyer is down 700 feet.—Ore is being shipped from No. 2 shaft of the Chip; daily output, thirty tons.—The old Harrison reduction works will probably be converted into a concentrating mill.

PUEBLO COUNTY.

During 1900 the American Smelting & Refining Co. at Pueblo produced 197,147 ounces of gold, 6,526,309 ounces of silver, 31,862 pounds of copper and 46,440 tons of lead.

SAGUACHE COUNTY.

The Biedell concentrator at Bonanza is sold to the Copper Star M. Co. for \$7000. The company will reconstruct the mill to run on ore from the Hanover.—Weems and others of New York are driving a tunnel into Rawley hill, in Rawley gulch, near Bonanza. Three shafts are working.—The Wall recently shipped two cars of ore running about \$100 in silver and lead to the ton.—The shaft on the Eagle, now down 200 feet, will be sunk to the 300-foot level.

SAN JUAN COUNTY.

The output of mines of the county for the year 1900 is estimated to be as follows:

Gold.....\$1,698,800
Silver.....1,709,000
Lead.....815,116
Copper.....261,000

Total.....\$4,483,916

SAN MIGUEL COUNTY.

Twenty men are working on the Silver Bell at Ophir Loop.—Work on the Meldrum tunnel at Telluride will probably be resumed soon.—During 1900 the Alta at Telluride has shipped 600 tons of high-grade ore and has concentrated 4000 tons of milling ore at the Gold King mill; 2700 feet of development has been done; level No. 4 is extended 1000 feet; N. J. Mansfield manager.—The tunnel on the St. Julien of the Palmyra group, near Telluride, is in 1000 feet. An additional 1000 feet is being run.

SUMMIT COUNTY.

The 40-stamp mill on the Jessie at Breckenridge, Supt. W. Wilson, will soon be running.—The Cashier, Manager Wood, will continue operations through the winter.—The 15-stamp mill of the Gold Bug, in Galena gulch, Manager J. Olson, is running steadily on ore from that mine.—Sinking on the Arkansas, on Gold hill, in Kokomo district, is in progress.—A new plant is going in on the Sunday (iron), recently leased by Leadville men.—The shaft at the Breene is going down steadily. Twenty-seven men are employed.—Manager Ingersoll of the Wintergreen is pumping out the mine. Operations will continue through the winter.—The Michigan is again running.

TELLER COUNTY.

The following table shows dividends paid by mines of Cripple Creek during the year 1900:

Stratton's Independence.....	\$1,226,000
Isabella.....	180,000
Lillie.....	130,000
Raven.....	40,000
Amazon.....	102,000
Gold Coin.....	240,000
Consolidated mines.....	120,000
Modoc.....	60,000
Golden Cycle.....	120,000
Last Dollar.....	60,000
Strong.....	300,000
Independence T. & M. Co.....	112,500
Elkton.....	33,750
Elkton Con. G. M. Co.....	225,000
Mary McKinney.....	150,000
Favorite G. M. Co.....	48,000
Touraine.....	77,000
Amanda.....	6,000
Greater Gold Belt.....	76,000
Omega.....	18,187
Lake City Leasing Co.....	3,875
Santa Rita.....	4,000
Southern Boy.....	17,500
Anderson G. M. Co.....	15,000
Acacia.....	45,000

Midget.....	120,000
Portland G. M. Co.....	750,000
Indicator.....	189,540
Gold King.....	118,105
Granite.....	60,000

Total dividends in 1900.....\$6,450,994

During 1900 the samplers in the Cripple Creek district handled 211,731 tons of ore, valued at \$11,156,261.80, divided as follows:

	Tons.	Value.
Rio Grande.....	81,231	\$3,005,261 80
Taylor & Brunton.....	60,000	4,500,000 00
Cripple Creek S. Co.....	63,000	3,276,000 00
Eagle.....	7,500	375,000 00

Totals.....211,731 \$11,156,261 80

The output of the mills and smelters of Cripple Creek for the month of December, 1900, is given as follows:

Mills.	Tons.	Value.
Colo.-Philadelphia.....	9,500	\$373,000
Bimetallic.....	9,300	230,000
National.....	4,100	145,000
Economic.....	3,000	90,000
El Paso.....	3,500	88,000
Arequa.....	1,900	65,000
Smelters.....	13,000	1,010,000

Totals.....44,300 \$2,001,000

The shaft on the Indicator, at Victor, is down 100 feet, and crosscutting is in progress at that depth.—The Unexpected, at Windy Point, is abandoned.—Standard & Co., operating on Block No. 3 of the Mountain Beauty, at Victor, recently shipped fifteen tons of ore, ranging in value from \$150 to \$1200 to the ton.—Sinking on the Bonnie Nell is temporarily suspended on the 300-foot level; a crosscut is being run at the 250-foot level.

GEORGIA.

During 1900 the estimated yield of gold and silver is as follows:

Gold, value.....\$120,165
Silver, ounces.....165

IDAHO.

BLAINE COUNTY.

F. R. Reed, representing New York men, has bought the Liberal group, 28 miles northwest of Hailey; thirty men will be put on and development begun.

A 13-foot ledge, high-grade gold-copper ore, is opened up on the 500-foot level of the Tiptop, at Hailey.—The Minnie

Moore M. Co., Ltd., capital \$500,000, is incorporated at Hailey.

Work on the Minnie Moore, at Broadford, will be resumed shortly; about twenty men will be put on; shaft will be retimbered.

CUSTER COUNTY.

Enough ore is said to be blocked out at the Lucky Boy, at Custer City, to keep the 80-ton mill supplied for the next three years.

The Black group, recently sold to Philadelphia men, has a 10-stamp mill; a cyanide plant will be added during the winter.

FREMONT COUNTY.

The dredger of the Heintz Gold Extraction Co., operating on the Snake river, near La Belle, was burned on the 28th ult.; loss, \$15,000; it will be rebuilt; the dredger had a capacity of 1000 tons per day; Supt., J. K. Korty.

IDAHO COUNTY.

The shaft on the Big Buffalo group, at Buffalo, is down 200 feet; mill is running steadily.

OWYHEE COUNTY.

Supt. J. Russell of the Pauper at Silver City will start drifting. The shaft is down 500 feet.

SHOSHONE COUNTY.

During 1900 shipments of ore from the Cœur d'Alene mines increased from 12,000 tons in January to 15,000 tons during December; 2200 men were employed at the beginning of the year. About 3500 were working in mines, mills, etc., at the close of December, entailing a payroll of nearly \$12,000 per day.

During 1900 the daily output of the Morning M. Co. at Wallace has increased from 800 tons to 1000.

No. 5 tunnel in the Keep Cool, Lake Pend d'Oreille district, is in 310 feet; recently a vein of ore 18 inches wide was opened up; samples run \$28 to the ton in silver, lead and gold.

The tunnel on the Headlight at Wallace is in 400 feet. Progress is at the rate of about 100 feet per month.

MARYLAND.

The estimated gold yield of the State for 1900 is \$186.

MICHIGAN.

During the year 1900 the yield of gold and silver is given as follows:

Gold, value.....\$207
Silver, ounces.....13,100

MISSOURI.

JASPER COUNTY.

The zinc and lead production of the county for the year 1900 is given as \$5,339,629.

MONTANA.

Director of the Mint Roberts estimates the gold and silver yield of the State for 1900 as follows:

Gold, value.....\$5,126,615
Silver, ounces.....16,750,000

LEWIS AND CLARKE COUNTY.

The Spotted Horse, near Helena, is bonded to Cahill, Johnson, Head & Clarke; development on a large scale will begin shortly.

MADISON COUNTY.

Gilbert & Parker are sacking ore for shipment at the White Pine, near Pony.—Ore from the Pony, at Pony, is said to run \$200 to the ton.—The tunnel on the Noble, on Wisconsin creek, near Sheridan, is in 2000 feet; it taps the lead on the incline at a depth of 1400 feet; a 600-foot upraise is run from the tunnel, and will be driven additional 400 feet to secure perfect ventilation; ore is shipped to the Colorado smelter at Butte.—Operations on the Klondike, near the Noble, will begin soon.—The Wisconsin creek placers have closed down for the season.

An assessment of 3 mills on the dollar is levied by the Centennial Toledo G. S. L. & C. M. & M. Co. of Sheridan.—Good ore is taken from the Single Standard on Wisconsin creek.—The mill at the Germania is running steadily.

MEAGHER COUNTY.

The shaft on the Silver Belt at Neihart, now down 50 feet, will be sunk an additional 50 feet; a crosscut tunnel is being run.

MISSOULA COUNTY.

The Aladdin group and other claims in the Wallace district, near Missoula, are bonded to New York men.

PARK COUNTY.

A. Livingston, who recently leased the Revenue mill at Jardine, has bonded the Robinson mine at that place.

SILVERBOW COUNTY.

The lowest depth attained in the Butte district is 2200 feet at the High Ore, Diamond and Green Mountain of the Anaconda Co.—During the year 6700 feet of sinking have been done in the district.

The shaft on the Pennsylvania is down 1400 feet.—On the Parrot the shaft is down 1600 feet.—Total depth of all shafts in Butte district is 47,890 feet.

NEVADA.

LANDER COUNTY.

Work on the Thorpe group (antimony), 7 miles south of Austin, is going ahead; a new hoist went in some time ago, and the main incline is now down 250 feet; a crosscut will be run, and three 8-hour shifts will be put on. Should development be satisfactory reduction works may be put in this spring; J. Thorpe & Son & J. G. P. Stokes, owners.

LINCOLN COUNTY.

C. M. Over is shipping a car of copper ore from the January mine. H. White, S. Yount and J. N. Hale have bonded their interest in the Columbia and Boss mines to J. R. Walker et al, of Salt Lake, Utah. The latter has also bonded the Double-Up mine. These are all copper properties. Work has been resumed on the Green Monster; Supt., J. Wilkinson. Goodsprings, Jan. 3.

ORMSBY COUNTY.

Drilling for oil will begin at Carson.

STOREY COUNTY.

Crosscut No. 2 on the 1000-foot level of the Caledonia, Virginia, is extended 76 feet.—Ten cars of ore recently taken from the 900-foot level of the Overman, ran \$18.03, of which \$10.10 was gold.

During week ending January 5th the Con. California and Virginia, Virginia, shipped 39,090 pounds of concentrates to the Selby Smelting & Lead Works, San Francisco.—The blower in the central tunnel of the Ophir is now run by electric power furnished by the Truckee River General Electric Co.—The Hale & Norcross tunnel is in 1952 feet.—Ore from the 425-foot level of the Gould & Curry recently shipped assayed \$4.90 (coin) per ton.

WASHOE COUNTY.

Supt. Scidmore, of the E. M. & R. Co., Reno, will put on men and start up operations at the mines soon; the smelter will also resume.

WHITE PINE COUNTY.

On the Pilot Knob, Morris and Jupiter groups, near Ely, three shafts are being sunk.—The new plant on the Robust will be running January 31st; mill has daily crushing capacity of 100 tons; a strike of \$100 ore is reported.

The new mill of the New Chainman M. Co. at Ely is to be enlarged to 125 tons daily capacity; a new building, 36x125 feet, will be put up; steam power now used will probably be replaced by electric power soon; shoots are being cut from the 200-foot level to ore bodies on the 150 foot and 100 foot levels.

NEW MEXICO.

The gold and silver output of the Territory for 1900 is given as follows:

Gold, value.....\$900,000
Silver, ounces.....600,000

GRANT COUNTY.

J. A. Cerillos has bonded the Lord Nelson at Central; new machinery will be put in and development work begun.—The new amalgamating mill of the Wilson M. Co., going in on the Volcano in Stein's Pass district, is nearing completion; a 5-mile pipe line is going in.—On the Maggie M. a horse-whim is in over No. 3 shaft, which is 70 feet deep; shipments of 100 tons of ore weekly will soon begin.—At Red Rock the main shaft of the Alessandro M. Co. is down 100 feet; another shaft is started; sixteen men are employed; regular shipments of ore are being made.—Barksdale & Burnett have leased the Copper Queen at Pinos Altos and are now working the same.

SANTA FE COUNTY.

The Santa Fe G. & C. Co. has bought coal lands near Ortiz station for \$7900.

Giltner & Van Horn will put up a mill on property in the Sandia mountains, south of Cerillos.

SOCORRO COUNTY.

Gems resembling diamonds are reported found near Capitan, 80 miles north of Alamo Gordo, by J. J. Blow, formerly connected with the Consolidated Co. at Kimberley, South Africa.

TAOS COUNTY.

Supt. Sewall has work well under way on the McGinnity, near Red River.—New machinery is going in at the Black Copper.—J. Moad and others will work the Esther at Red River. The ore is lead, copper and gold.—The new mill recently put in on the June Bug will begin treating ore soon.—Work is progressing satisfactorily on the Golden Treasury.—The Copper King is shut down for repairs.

NORTH CAROLINA.

The estimated gold and silver produc-

tion of the State for 1900 is given as follows:

Gold, value.....\$51,018
Silver, ounces.....13,092

OREGON.

BAKER COUNTY.

C. Bonner of Butte, Mont., has a contract for running a 600-foot tunnel on the Diadem, in the Greenhorns, near Sumpster, to be completed in five months.

Tunneling is in progress on the Harth (quartz) at Galice. Work on the Gold King and Ruster (quartz) mines on Forest creek is resumed. A. B. Cousin is pushing work on his hydraulic mine on Galice creek, near Galice. A. Dean is working the Dean (placer) on Rogue river. An additional water supply will be obtained from Centennial gulch.

Work on the Baisley-Elkhorn, near Baker City, is resumed; the two Bryan mills are running; shaft is down 550 feet; C. E. Whitaker, Supt. A new mill will go in on the Chloride next spring. The shaft on the Copper Queen, now down 35 feet, will be sunk to the 100-foot level. The new 10-stamp mill at the Columbia, in the Cracker creek district, is about completed. The new 1 1/2-mile tramway at the North Pole is nearing completion and will supply the mill with about ten tons of ore per hour. It is reported that the mill at the E. & E. may soon resume. A 500-foot tunnel is being run on the Colorado. Work on the Venus group is going ahead. At the Minneapolis, near Bourn, a tunnel is being driven; it is in 85 feet.

CURRY COUNTY.

Bodley & Co. are shipping twenty tons of ore from their property at Mule mountain, near Gold Beach, for a test; if results are satisfactory a mill will be put in. Muncey & Wright have run the tunnel in 145 feet on the McKinley group, near Gold Beach, and have opened up copper ore.

JOSEPHINE COUNTY.

Ore is being taken out at the Copper Stain at Leland.

SOUTH CAROLINA.

The gold and silver yield of the State for 1900 is estimated as follows:

Gold, value.....\$122,625
Silver, ounces.....395

SOUTH DAKOTA.

The estimated yield of gold and silver of the State for 1900 is as follows:

Gold, value.....\$6,617,676
Silver, ounces.....280,000

CUSTER COUNTY.

The Grand Junction, near Custer, is reported sold to New York men for \$200,000.

LAWRENCE COUNTY.

According to the mine inspector's report, the metal production of the Black Hills for 1900 is:

Gold.....\$10,000,000
Silver.....300,000
Wolfram.....50,000
Spodumene.....25,000
Copper.....15,000
Lead.....10,000
Mica.....10,000
Paint pigments.....5,000
Tin.....3,000

Total.....\$10,418,000

During the same period there were 4500 men employed, entailing a payroll for the year of about \$5,670,000.

A strike of rich ore is reported on the Dakota Maid, in Bear Butte district, near Deadwood; assays are said to run \$500 to the ton. The old Caledonia stamp mill, which has lain idle for ten years, is again in operation. A deal is said to be on foot for the sale of all the mining groups on Lead hill, at North Lead, including the Grantz, Harrison, Durango, Iowa, Golden Crown and others. Should the deal go through, it is likely that plants will be put in and development begun on a large scale. The Denver-Black Hills M. M. & D. Co. is organized to work the Cora, in Galena district; the stamp mill on the property is being repaired. The Homestake Co. at Lead is putting two old mills in shape to run, which, with the four already in operation, will give a total of 840 stamps dropping, with a capacity of nearly 3500 tons per day. Plans are on foot, it is said, to increase the number of stamps to 1000; 950-pound stamps are used. The deepest shaft is down 1700 feet. Most of the ore being worked at the present time comes from the 500 and 600 foot levels; 2000 men are employed, with a payroll amounting to \$200,000 per month. The new hoisting plant furnished by the Union Iron Works of San Francisco is about in; it has a capacity for sinking to a depth of 3000 feet; Gen. Supt., T. J. Grier.

The Clover Leaf M. Co., operating the Uncle Sam at Perry, has started up its 20-stamp mill on ore from that mine; N.

Treweek manager. A strike is reported on property of the Gladiator G. M. Co., operating on the Homestake belt, near Deadwood.

PENNINGTON COUNTY.

The Elizabeth M. Co., operating the Blismarck, at Keystone, is experimenting with the cyanide process on ores from that mine. On the Chilkoot, 4 miles northwest of Keystone, ore running \$400 to the ton is reported opened up. The Crown Hill M. Co. will enlarge its fifty-ton concentrating plant at Keystone to 100 tons daily capacity; the shaft on the Crown Hill, now down 300 feet, will be sunk an additional 200 feet. The spodumene property near Keystone is reported sold to New York men for \$6000; a contract is let to ship 500 tons of spodumene ore, from which lithia water is extracted to New York.

TEXAS.

Estimated yield of gold and silver of the State for 1900 is as follows:

Gold, value.....\$7,000
Silver, ounces.....500,000

TENNESSEE.

During 1900 the State produced \$206 in gold and one ounce of silver.

UTAH.

IRON COUNTY.

The Stateline mining district is 75 miles southwest of Milford, 65 miles west of Cedar City, 17 miles west of Modena, the nearest shipping point on the Utah & Pac. R. R., 2 miles east of the Nevada State line, 85 miles northeast of DeLamar and 35 miles east of Pioche, Nev. A 5-foot vein of ore is opened at a depth of 153 feet in the Aggie; shaft is down 170 feet.

JUAB COUNTY.

At the Lower Mammoth, at Tintic, the machinery is being overhauled and work in the mine is suspended; ore bins are nearing completion.

In the suit of the Mammoth vs. the Grand Central, Tintic, decision is rendered in favor of the latter.

Work is in progress on the Iron Cap, near Mountain Home.

The La Reine M. Co. has increased its capital stock from 250,000 shares to 300,000 shares at \$1 each. Pending suit between the Four Aces and the Swansea, at Silver City, the former has laid off all but four men; Supt. Lee. An assessment of 1/2 cent per share is levied by the Pic Nic M. Co. of Silver City. A tunnel is being run from the 600-foot level of the El Rey to tap the Sunbeam vein at a depth of about 1000 feet. The construction of the new concentrator to go in on the Tesora, at Tintic, will begin soon.

The Shoshone Bonanza, at Diamond, Tintic district, Manager Heffron, made a shipment of ore recently that ran 10% copper, twenty ounces silver, 10% lead and about \$1 in gold to the ton. Samplings of the ore from the Tesora, at Tintic, to date, show an average of 10% copper, with gold and silver of about \$9 to the ton; output of ore is about one carload per day.

Driving the 800-foot level in the Lower Mammoth, at Tintic, is in progress.

The output of the Godiva, at Tintic, for 1900 was 4900 tons of ore, that averaged twenty-three ounces silver, 20% lead and 60 cents gold per ton.

The Sioux-Ajax Co., at Tintic, will begin operations. Supt. Watson of the Eureka Hill has men extracting ore; more men will be put on. Ore from the strike recently made on the 600-foot level of the Mammoth is said to run 9000 ounces silver to the ton; another strike is reported made on the 1800-foot level.

The Lower Mammoth, at Tintic, is shipping ore; the new air compressor will be in place in February.

MILLARD COUNTY.

The Orizaba M. Co., F. E. Bostwick manager, is sinking a shaft on the Orizaba, 6 miles from Smith's Station, on the Oregon Short Line; samples of ore show 10% copper, seventeen ounces silver and a small amount of gold to the ton.

SALT LAKE COUNTY.

Ore recently opened up on the 400-foot level of the Silver Cord, at Bingham, runs 32% copper and \$240 gold to the ton. The Mayflower M. Co. of Bingham has levied an assessment of 1/2 cent per share—\$2000. An assessment of 1/2 cent per share was levied on the 5th inst. by the Gonyon M. Co., delinquent Feb. 5.

The Bingham C. & G. Smelter, Bingham, will start up on a trial run on the 15th inst.

The Shawmut M. Co., Bingham, Manager W. B. Andrew, recently issued \$50,000 bonds for development purposes. Manager T. R. Jones of the Mingo smelter at Sandy, which closed down recently, states that it will resume operations next month. T. Pells is shipping silver, lead and copper ore from the Rough Rustler at Bingham; three tunnels, with a total length of 500 feet, are

run on the property. Assays of ore from the Erie, in Markham gulch, near Bingham, now being operated by R. Palmer, give 20% lead, 17% copper and 13 ounces of silver to the ton.

The Dewey Con. C. & G. M. Co., capital \$30,000, is incorporated to work the Dewey group of five claims at Bingham; group was bought recently for \$25,000; A. L. Morris, manager. Two cars of ore recently shipped from the Red Wing, Bingham, returned \$30.96 net per ton. Peters & Leland, representing Eastern men, are reported to have bonded the Turngren at Bingham for \$100,000. At a special meeting of the Shawmut M. Co. of Bingham the recent issue of \$50,000 in 7% five-year bonds was ratified. Title to all former holdings of the New Mammoth M. Co. at Bingham, consisting of six claims and an up-to-date mill, has passed into the hands of President F. Knox of the National Bank of the Republic, Bingham.

The Highland Boy, Bingham, during 1900 produced 5,809,886 pounds of copper, gold and silver bullion, valued at \$1,278,174.92.

Two cars of ore were recently shipped from the Mammoth at Bingham, from which it is expected returns will be \$16,000.

Supt. Mayberry has seventy-five men working at the United States, Bingham.

SUMMIT COUNTY.

At the Mackintosh sampler, at Park City, 73,003 tons of ore were treated during the year 1900, amounts of ore from various mines being as follows:

	Tons.
Crescent.....	19
Valeo.....	294
Apex.....	631
Anchor.....	7,376
Ontario.....	5,749
Daly-West.....	25,356
Silver King.....	33,578

Total.....73,003

A new boiler is going in at the Daly-West at Park City, and the mill is being enlarged to treat thirty tons of ore additional per day; a winze is being sunk from the 1400-foot level; Supt. Kirby.

There are about 200 men employed in the mills at Park City.

TOOELE COUNTY.

The Bunker Hill at Stockton is shipping ore to Salt Lake. The new roaster at the Sacramento, Mercur, will start up Feb. 1.

The mill at the West Argent, at Stockton, Manager Jacobson, is running.

UINTA COUNTY.

Fifteen gilsonite claims near Vernal were recently sold to S. Johnson of St. Louis, Mo., for \$3500.

VIRGINIA.

Estimated yield of gold and silver of the State for 1900 is given as follows:

Gold, value.....\$3,534
Silver, ounces.....285

WASHINGTON.

Director of the Mint Roberts estimates gold and silver yield of the State for 1900 as follows:

Gold, value.....\$826,873
Silver, ounces.....300,000

FERRY COUNTY.

The ledge on the Elk on Toroda creek, near Bodie, is said to be from 6 to 10 feet wide. The tunnel on the Bodie is driven 374 feet; ledge is expected to be cut at about the 400-foot mark; shaft is down 26 feet. The old tunnel on the Oxford is being extended. The two-compartment shaft on the Mountain Lion, Republic, now down 450 feet, will probably go an additional 200 feet. Operations on the Iconoclast, at Keller, will resume in March. McMaster & Kinney are sinking a shaft on the Cash, west of the Gold Cord.

KING COUNTY.

The receipts of gold and silver at the U. S. assay office in Seattle during 1900 were 461 tons; total quantity of gold for the year was 1,345,122.41 troy ounces, with an assayed value of \$22,038,755.12, representing the individual deposits of 7106 persons.

OKANOGAN COUNTY.

Mazama is a new postoffice at the mouth of Goat creek, 13 miles up the Methow river from Winthrop. Barron is a post-office at Slate creek, 24 miles up the river from Mazama. Slate creek has two stamp mills working successfully on good ore. In the immediate vicinity of Mazama there are a number of gold and copper properties now under development. The most prominent are the Dry Tree G. M. Co., Goat Creek M. Co., Methow G. M. Co., T. & B. M. Co. and American Flag M. Co. Mazama, Jan. 3.

YAKIMA COUNTY.

There are about 200 claims in the Summit district, near North Yakima, and about 75 men are employed on them.

WYOMING.

Estimated mineral output of Wyoming for 1900 is given as follows:

Coal.....	\$4,000,000 00
Gold.....	1,198,240 20
Copper.....	1,009,346 90
Iron.....	440,651 17
Silver.....	61,004 86

Total.....\$6,709,243 13

Annual output of coal is said to be 3,500,000 tons.

The gold yield of the State for the year 1900 is given as \$24,806.

CARBON COUNTY.

The shaft on the Rudefeba of the Ferris-Haggerty, at Grand Encampment, now down 250 feet, will be sunk to the 500-foot level; ore is shipped overland in wagons 60 miles to Walcott, on the Union Pacific, and from there to Denver by rail; wagon freight alone runs from \$10 to \$15 to the ton.

FOREIGN.

The Onondaga M. Co., operating a group of nine claims at the head of Champion creek, near Waterloo station, on the Nelson & Ft. Sheppard Railway, has thirty men working. A new stamp mill is going in. A 4-mile tramway may be put in. A strike is reported made in No. 5 tunnel of the Ruth at Sandon. The Paradise, Northeast Kootenay, Manager Bruce, in seven months has shipped 1000 tons of ore. No. 4 tunnel is now in 300 feet. An upraise will be run from No. 4 tunnel to the bottom of the incline of No. 2 tunnel. At New Denver work will begin on the Molly Hughes group soon. The Hartney, 3 miles southeast of New Denver, will begin shipping ore.

A strike of good ore is made on the 250-foot level of the Brooklyn at Phoenix. A strike is also reported made on the 200-foot level of the Stemwinder. Shipments of ore from the mines in the Boundary district, near Phoenix, for the year 1900 are given as 103,723 tons.

Work on the Neglected, near New Denver, is resumed. The May & Jennie, on Forty-nine creek, 8 miles from Nelson, recently bonded to the United Mines, Ltd., a French company, represented by J. J. Fleutot of Nelson, is under development. A 10-stamp mill will be put in. One hundred additional men were put on at the War Eagle, Rossland, last week. After a cessation of nine months shipments of ore were resumed recently. One hundred tons of ore daily are shipped from the 250-foot level. During the week ending January 5 the following shipments of ore from the mines at Rossland were made:

	Tons.
Le Roi.....	2,800
Center Star.....	1,080
War Eagle.....	210
Le Roi No. 2.....	157
Iron Mask.....	135

Total.....4,382

The 18-drill compressor plant is going in on the Velvet. A spur from the Red Mountain line to the Velvet, Douglas and other mines on Sophie mountain will be run up Sheep Creek valley, 9 miles. When completed, ores from these mines will be sent to the Northport, Wash., smelter. The work of enlarging the Granby smelter at Grand Forks will begin April 1. It is estimated that the mines at Rossland will turn out 600,000 tons of ore during the year 1901, of a gross value of \$8,000,000.

During the week ending Dec. 29th, 4186 tons of ore from the Knob Hill, Victoria and Old Ironsides mines, at Grand Forks, were treated by the Granby smelter. A project is reported on foot to run a tunnel from Silverton to Sandon, a distance of 6 miles.

A payment of \$25,000 is made on the Utica group at Kaslo. Near Crow's Nest Pass, 276,000 acres of coal lands, belonging to the Crow's Nest Pass Coal Co., are reported sold to the Great Northern Railway Co. for \$5,000,000; the company will build a road to the fields, it is said.

The output of the mines at Rossland for the year 1900 amounted to 221,902 tons (approximately)—an estimated value of \$3,500,000.

On the Nettie L., Lardeau, the new winze in the crosscut is down 60 feet; the output of ore is ten tons daily. A tunnel is being driven on the M. & V. group, on Twelve-Mile creek, near Nelson. Lade & Ferguson, operating the Truine, recently shipped eighty tons of ore to the Trail smelter, returns from which were as follows:

Gold, 71.28 oz., at \$20.67 3/4 oz....	\$ 1,473 36
Silver, 24,470.07 oz. at 62c 3/4 oz....	15,171 44
Lead, 73,468 lbs. at \$4 3/4 100 lbs....	2,938 72

Total.....\$19,583 52

The War Eagle at Rossland is shipping ore from the 250-foot level to the Trail smelter. Shipments of ore from the

mines at Rossland amount to 9000 tons per week. During the week ending Dec. 29th shipments of ore from the mines at Rossland were as follows: Le Roi, 2072 tons; Centre Star, 1800; Le Roi No. 2, 75; Iron Mask, 175; Giant, 43; I. X. L., 25. Total, 4190 tons.—The shaft in the Le Roi No. 2, now down 600 feet, will be sunk an additional 200 feet.—Work on the foundation for the new compressor for the Rossland Great Western is progressing; shaft is down 700 feet.—Sinking is in progress on the Columbia and Kootenay at Kootenay.—The I. X. L. is shipping ore.

At the Knob Hill, Phoenix, a cut from 250 to 350 feet wide will be made into the mountain a distance of 2400 feet.—The Old Ironsides workings are connected with a 200-foot winze sunk from a point 800 feet inside of the tunnel. Two hundred and fifty men are employed.—The stamp mill at the Chapleau, Slocan, is treating twenty-five tons of ore daily.—More men have been put on at the Standard, on Republic hill.—The Evening Star group, on Dayton creek, will be opened up again soon.—Work is in progress on the Morning Star, on Springer creek.—H. L. Frank of Butte, Mont., has bought 2560 acres of coal land near Lethbridge.—The Lake Shore C. M. & D. Co., capital \$1,000,000, is organized and incorporated at Chicago, Ill., to work the Blue Bell and J. S. claims in Summit camp.—The vein on the Tamarac, Nelson, is opened up at the bottom of the 300-foot winze run from the bottom of the lower tunnel.—The London & B. C. Gold Fields, Ltd., will put in a mill on the Enterprise.—A Robins conveyor will go in at the St. Eugene, East Kootenay.—The Dardanelles M. & M. Co., owning the Dardanelles, Diamond Cross, Dardanelles No. 2, Okanagan, Lady of the Lake, Bosphorus and Gibraltar, in the Dardanelles basin, 4 miles from Sandon, at a recent meeting of the stockholders decided to borrow \$45,000 for development purposes. The plant on the property consists of a 50 H. P. boiler, a 20 H. P. sinking pump, a 5-drill Rand compressor, etc.—Shipments of ore from the Boundary Creek mines, near Greenwood, for the last six months of 1900 are as follows:

	Tons.
July.....	3,150
August.....	5,850
September.....	9,000
October.....	13,800
November.....	18,300
December (estimated).....	19,500
Total.....	69,600

During 1900 it is estimated that \$1,000,000 have been spent by the various mining companies operating at Rossland in improving and adding to their mechanical equipment, the new machinery, etc., at the Le Roi having cost about \$500,000 alone.—The new compressor going in on the Nickel Plate will be operated by electric power.—A new compressor, to be operated by electric power, is to go in at the Evening Star. An order for the same is given and it will probably be in place early in the spring.—The 10-drill air compressor recently put in by the New St. Elmo Co. is not being operated at present, owing to mechanical defects.—A new compressor for the Velvet is going in.—The West Kootenay Power & Light Co. will spend \$1,000,000 during the coming year in developing 20,000 additional horse power from its water rights on the Kootenay river.

MEXICO.

The Sirena (gold), in the Guanajuato district, worked by the Mexicans from 1550 to 1822, when it became flooded with water and abandoned, is being unwatered by the Guanajuato Co. of New York; pumps operated by electricity are used, and electric power will be used in developing the mine after it is unwatered.—A German company, which recently bought the Valenciana, is unwatering that mine by the same methods employed in the Sirena.

At the Monterey, Sonora, the motive power of the sampling mill at Smelter No. 3, which has been steam, is being changed to electricity. In the place of the two engines which have been running the various ore crushers and rolls, a 70 H. P. electric motor will be substituted.

During 1900 the works of the American Smelting & Refining Co., at Durango, produced the following:

Gold, ounces.....	43,743
Silver, ounces.....	1,701,875
Copper, pounds.....	1,252,363
Lead, tons.....	7,792

The Escudra gold mine, near Oaxacan, State of Oaxaca, is reported sold to New York men for \$3,500,000.

The Cornish rolls at the Lampazos mines, at Lampazos, Sonora, will be replaced by ten stamps; Supt. O. Routree.—At Placeritas the Moctezuma Copper Co. is completing its new 400-ton-per-day plant; mine is 6 miles from mill, and ore will be hauled by a narrow gauge railway.—A. J. Brandt has completed his new

combination mill at Churinibabi, 4 miles north of Placeritas.—The 10-stamp mill of the San Miguelito M. Co. is running on ores from the El Creston de Oro, Good-enough and San Jose mines.

ONTARIO.

The November cleanup of the Mikado, on Shoal Lake, near Rat Portage, was \$12,000; it is expected that a saving of \$1.50 to \$2 per ton has been made by new machinery recently put in; Manager McMillan.

Personal.

V. M. CLEMENT of Salt Lake, Utah, is in Mexico.

D. W. BRUNTON of Denver, Colo., is in Butte, Mont.

J. C. GRIFFITHS of Salt Lake, Utah, is in Denver, Colo.

S. CROASDALE of Denver, Colo., is in Bingham, Utah.

S. NEWHOUSE of Salt Lake, Utah, has gone to Europe.

G. C. MOORE of Salt Lake, Utah, is in Wyandotte, Kan.

C. M. FASSET returned from Corea this week to Spokane, Wash.

C. KIMMERMAN AND A. LENKE, of Chicago, are in Bingham, Utah.

J. S. LAWTON, of the Queen of Sheba, Deep Creek, Utah, is in Chicago.

C. S. FRY of Cripple Creek, Colo., has returned there from Seattle, Wash.

J. H. SHOCKLEY is now manager Turkey Creek mine and mill, Telluride, Colo.

C. O. BAXTER, of the Gilson Asphalt Co., of Salt Lake, Utah, is in California.

J. LEZINSKY of New York and E. S. De Gallier of Boston, Mass., are in Clifton, Ariz.

P. WISEMAN of Butte, Mont., is now manager Shannon Copper Co., Clifton, Ariz.

A. C. MORRISON, Supt. Crystalline, Sonora, Cal., is convalescing in San Francisco.

J. CREIGHTON, Supt. Tesora M. Co., Tintic, Utah, has returned from Hailey, Idaho.

J. H. MCKENZIE, Mariposa C. & M. Co., has returned to San Francisco from Colorado.

PRES. CORAM AND SEC. WILLER of the Bingham C. & G. M. Co., are in Bingham, Utah.

A. H. GUNNELL, assayer for the Baisley-Elkhorn, Baker City, Or., is in Salt Lake, Utah.

C. C. BRAGG of Cincinnati, Ohio, and G. M. Nelson of St. Paul, Minn., are in Gilt Edge, Mont.

SUPT. WRENN of the Century Oil Co., Bakersfield, Cal., has returned there from San Francisco.

SUPT. W. DOUGLAS, of the Copper Queen, Bisbee, Ariz., has returned there from New York.

A. W. STODDARD of London, Eng., is in Salt Lake, Utah; from there he goes to British Columbia.

W. B. ANDREW, manager Shawmut M. Co., Bingham, Utah, has returned there from the East.

E. A. CARTER, president, and W. B. Thompson, treasurer, of the Shannon Copper Co., are in Clifton, Ariz.

G. K. FISHER, Supt. construction Highland Boy smelter, Bingham, Utah, has returned there from San Pedro, N. M.

A. E. ELLIOTT AND A. P. AYLING of the New England Copper Co., Clifton, Ariz., have returned to New England.

I. S. FOORMAN, president Mokelumne & Campo Seco C. & M. Co., has returned to San Francisco from Calaveras county, Cal.

F. W. GRIFFIN, Pacific coast agent Bucyrus Co., left San Francisco for Milwaukee, Wis., on the 10th, on a wedding trip.

JOSEPH MACDONALD, the new manager of the Alaska Treadwell G. M. Co.'s properties at Douglas island, arrived there Dec. 22.

THOS. CLARK has returned to El Dorado Co., Cal., from the East, and is negotiating for the Gentle Annie and other properties.

GEO. H. PROCTOR of Colo. and Lord Thurlow of England are in San Francisco in connection with acquisition of California mining properties.

T. G. TEMPLE has been appointed foreman Bear Mountain mines, Colville, Wash. Superintendent C. G. Carruthers says the company will run 700 feet of tunnel.

C. W. GOODALE, superintendent of the Boston & Montana smelters at Great Falls, has given to the museum of the Montana School of Mines his large collection of ores and minerals. Prof. Winchell, of the

school, says that it is the most valuable that has been received by the institution. The collection includes over 1000 specimens.

J. R. SCUPHAM, manager Boston-South Dakota M. Co., recently seriously injured at Colfax, Cal., is at the Turkey Hill mine, Placer county, Cal., where his company has installed an electric plant.

D. S. JORDAN has been elected president San Francisco Academy of Sciences; corresponding secretary, J. O'B. Gunn; recording secretary, G. P. Rixford; treasurer, L. H. Foote; librarian, L. Falkenau; director of museum, C. A. Keeler. Trustees—W. M. Pierson, J. F. Houghton, W. H. Crocker, C. E. Grunsky, E. J. Molera, G. C. Perkins, G. W. Dickie.

Commercial Paragraphs.

ON the 1st inst. A. Leschen & Sons' Rope Co., main office 920-922 North First street, St. Louis, Mo., opened a New York City office and warehouse at 92 Center street, corner of Leonard. This company owns and manufactures the Leschen patent aerial wire rope tramway, used to transport ore, rock, dirt, timber, etc., which it loads and unloads automatically.

The free scholarship offer made in another column by the American School of Correspondence, Boston, Mass., is worthy of notice. Without leaving home or losing time from work, the student pursues a course of study, instruction papers, prepared especially for teaching by mail, being furnished free. In addition, special information regarding any difficulties in their studies is furnished students without any extra charge. It should be the ambition of every man to advance in his trade or profession. A mechanic with practical experience, supplemented by theoretical education, can command a better position than a man without such an education.

Books Received.

"Field Manual for Engineers," 16 mo., 401 pages, 152 figures, morocco; author, P. H. Philbrick. He says it is his intent to present the subjects of the text in a mathematical and logical order; to classify all problems presented so as to be easily referred to, and to express the resulting formula of every problem in the form requiring the least numerical computation, in all of which he has achieved an unusual measure of success. Published by Jno. Wiley & Sons, New York City; price, \$3.

Catalogues Received.

"Wire Rope and Its Application to the Transmission of Power," etc., is the latest booklet issued by the Trenton Iron Co., Trenton, N. J. There are several good things in it. The chapter on "The Effect of Bending Upon Wire Rope" could be read with profit by every user thereof. The booklet will be sent upon application.

Recently Declared Mining Dividends.

	Payable.
Daly-West M. Co., Utah, 30 cents per share, \$45,000.....	Jan. 5
Empire State-Idaho M. Co., Idaho, 30 cents per share, \$29,554.20....	Jan. 15

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

APPARATUS FOR AGING WINES OR LIQUORS.—No. 664,538. Dec. 25, 1900. A. B. C. Dowdell, St. Helena, Cal. This invention consists of a vertical wooden tank having vertical tubes extending from top to bottom, and means including flanged plates fitted to the ends of the tube for forming close joints with the tank bottom. There is an exterior chamber within which the tank is contained, and means for heating and means for circulating the air through the tank, and within the chamber; also means for protecting the tubes against leakage when the wine is withdrawn from the tank, consisting of disks fitting over the bottoms of the tubes and screw rods extending upwardly, transverse bars at the tops, and nuts screwing upon the upper ends of the rods by which the closure plates at the bottom are drawn tight whereby tubes may be filled with liquid to prevent contraction.

FOLDING BEDS.—No. 664,539. Dec. 25, 1900. Daniel Eisner, San Francisco Cal., one-half assigned to J. J. Justice, New York, N. Y. This invention relates to improvements in that class of furniture

known as "folding beds," in which the device is extended for use as a bed and when closed up is made to resemble some other article of furniture and conceal its true identity. It consists in the combination in a folding bed of the head and foot portions with a lazy-tongs connection whereby they are extensible or closable toward each other, jointed pivoted side rails and a mattress carried thereon. A board is hinged to the head portion and is foldable so as to form a top when the device is closed together. There is a latch by which the foot portion of the structure is locked so as to resemble a bureau front, and boxes are hinged to the sides of the head section turnable in horizontal planes about the hinges, said boxes having angular notches adapted to engage corresponding notches in the board when the latter is turned upwardly about its hinges and prevent its falling when the bed is extended.

FASTENING FOR STRUCTURAL IRON.—No. 665,194. Jan. 1, 1901. G. H. Dyer, San Francisco, Cal. This invention is designed to provide a means for securely and economically locking the parts of iron structures together, such as prison cells, animal cages, ships' gratings, window guards, sidewalk grates, floor, ceiling, wall and building construction generally, and also for fences, elevator inclosures, bookcases, shelving and a great variety of structures in which steel and iron largely enter. It consists of peculiarly slotted plates adapted to receive transverse bars extending through said plates and locking bars passing through the plates in such relation to the first named bars as to firmly lock and secure them and the plates together.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING JAN. 1, 1901.
665,158.—BORING MACHINE—W. R. Abrams, Portland, Or.
664,921.—DRAFT EQUALIZER—J. W. Aehart, Harrisburg, Or.
665,361.—WEIGHING MACHINE—J. W. Berry, Tacoma, Wash.
665,169.—CAR VENTILATOR—L. H. Bowman, Walla Walla, Wash.
665,057.—WRITER'S COMPANION—J. D. Brower, Salem, Or.
665,172.—CURRY COMB—J. Carden, Gardena, Cal.
665,192.—HYDRAULIC VALVE—D. C. Demarest, Angels, Cal.
665,194.—IRON FASTENINGS—G. H. Dyer, S. F.
665,365.—FRUIT CLEANER—G. H. Ferguson, Redlands, Cal.
665,204.—STRAP LOCK—H. P. Gehricke, Los Angeles, Cal.
665,088.—CAN BODY MACHINE—J. Gould, Jr., Berkeley, Cal.
665,215.—WINDOW WASHER—B. S. Harris, Oakland, Cal.
665,346.—FILTER—R. C. Reed, S. F.
664,896.—COILING PLASTIC MATERIAL—R. Robertson, Santa Cruz, Cal.
664,902.—EARTH AUGER—Scott & Gerry, New Whatcom, Wash.
665,277.—BUTTER SCOOP—R. A. Simpson, Ferndale, Cal.
665,374.—TIMS LOCK—H. C. Stockwell, Los Angeles, Cal.

Latest Market Reports.

SAN FRANCISCO, Jan. 10, 1901.

SILVER.—Per oz., Troy: London, 29½d (standard ounce, 925 fine); New York, bar silver, 63½c (1000 fine); San Francisco, 63½c; Mexican dollars, 50½c.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25 cash; carload lots, 17.00; electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.62½; Casting, 1 to 3 casks, 16.75; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.20; Missouri lead, \$4.32½ desilverized lead; San Francisco \$5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6½, sheet 7½, bar 6c; pig, \$4.70 @5.10. London, £16 6s 3d per ton.

The conditions as to trust prices remain unchanged—\$4 in Utah.

SPELTER.—New York, \$4.15; St. Louis, \$3.95; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9½c; San Francisco, 100-lb lots, 12c; 300 to 500 lbs., 13@14c; 1000-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, \$13.50; gray forge, \$13.75; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$19.75; open hearth billets, \$21.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$27.00; San Francisco, ton lots, 29c; 1000 lbs., 29½c; 500

Notice is hereby given that a special meeting of the stockholders of the RUBY GOLD GRAVEL MINING COMPANY will be held at the principal office of the Company, Room 24, 320 Sansome St., in the city of San Francisco, Cal., on TUESDAY, the 20th day of January, 1901, at 2 o'clock P. M., for the purpose of electing a Board of Directors and the transaction of such other business as may come before the meeting. JOSEPH H. MOOSER, Secretary Ruby Gold Gravel Mining Company 320 Sansome St., Room 24, San Francisco, Cal.

The Regular Annual Meeting of the Stockholders of the MUTUAL INVESTMENT UNION will be held at the principal office of said Corporation, said principal office being situated at No. 14 Sansome street, Room No. 15, San Francisco, California, on MONDAY, the 21st day of January, A. D. 1901, at the hour of 3 o'clock P. M. of said day; said meeting being held for the purpose of electing a Board of Directors to serve for the ensuing year and for the transaction of such other business as may come before the Meeting.

J. C. WINANS, Secretary of the Mutual Investment Union.
Principal office—No. 14 Sansome street, Room No. 15, San Francisco, California.

NOTICE OF AMENDMENT OF ARTICLES OF INCORPORATION.

Notice is hereby given that it is the intention of the JAMISON MINING COMPANY to amend its Articles of Incorporation by substituting for the second of said articles setting forth the purposes of the Corporation, which now reads:

"2nd. That the purposes for which it is formed are: To acquire title of quartz mines and gravel mines in the State of California, and to work the same for gold and silver; also, to acquire, hold and use water and water-rights and privileges in connection with such mining; also, to acquire, hold and use timber lands in connection with such mining." the following:

"Second.—That the purposes for which it is formed are: To mine for, and mill and reduce ores of all kinds; to acquire by location, purchase or otherwise, to own, hold, work and operate mines in and throughout the State of California; to acquire by purchase or otherwise, to own, hold, develop, improve, lease, let, mortgage, grant, bargain, sell and convey mines, and mining claims and properties in the State of California; to acquire by purchase or otherwise, to build, erect, construct, own, operate, lease, let, mortgage, grant, bargain, sell and convey mills, and other reduction and smelting works, for the milling and reduction and smelting of ores, and to deal in precious metals and minerals and the products of mines of every kind, and to transport and provide ways and means to transport the same to market, and to market and sell the same; to acquire, by purchase or otherwise, to improve, develop, own, hold, use, lease, let, mortgage, grant, bargain, sell and convey real property, lands, water, water-rights, privileges, and franchises of every kind, in and throughout the State of California; to buy, own, hold, sell and generally deal in goods, wares and merchandise, and all kinds of personal property, including the stocks of other corporations, also bonds, notes and personal securities of every kind. To establish and maintain agencies of said Corporation, and to appoint and employ agents, wherever it may be deemed best by said Company; and generally to do any and everything necessary, proper or expedient to carry out the aforesaid purposes and carry on the business of said Corporation.

NOTICE OF STOCKHOLDERS' MEETING.

A Special Meeting of the Stockholders of the JAMISON MINING COMPANY for the purpose of considering and acting upon the matter of Amending its Articles of Incorporation, as above provided, will be held at the office of the company, room 54, 120 Sutter street, San Francisco, California, at two o'clock P. M. on Monday, the 11th day of February, 1901.

By order of the Board at its meeting of December 31st, 1900.

SAM W. CHEYNEY,
Secretary Jamison Mining Company.

548 MISSION STREET, SAN FRANCISCO, CAL.

POINTS OF EXCELLENCE OF OUR NEW JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily re-packed.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.
Send us your inquiries.

W. T. GARRATT & CO.,

A BORE HOLE

is the cheapest, quickest, most direct, and most effective way to test lands for minerals, oil, gas, salt, sulphur, borax, water, etc.

THE STAR DRILLING MACHINES

excel for these uses. They will drill a hole through anything to any depth from 250 to 2500 feet. The only machines made that are absolutely without annoying springs. They are simple, powerful and efficient. Easy to handle at work or on the road. Used in every State and Territory and in many foreign countries.

We also make full line of drill tool-bits, reamers, sand pumps, spuds, etc., etc. Write for illustrated free catalogue.

Star Drilling Machine Co.,
Akron, Ohio.

It will do more and better work than any other Gravel Elevator.

It is fully protected by United States and Canadian letters patent.

THE COLORADO IRON WORKS COMPANY,

ENGINEERS AND MANUFACTURERS OF

Smelting Furnaces and Equipments.

The illustration in this advertisement shows one form of our COPPER MATTING FURNACE, employing hot blast; the air being first treated in proper appliance, is conducted through the cast iron bustle pipes placed along the inside of the caisson plates, through the cast iron adjustable tuyeres. This furnace can also be used for silver as well as copper smelting, by changing lining in crucibles. We build them in any size required.

Cold blast may be used if preferred.

The furnace is equipped with our special cast iron jackets, and our patented system of water-jacketed mantles.

Send for our catalogue, showing many different styles of smelters for the treatment of

GOLD, SILVER, LEAD, COPPER AND NICKEL ORES,

also the latest and best method for the economical use of jacket water (a saving of 80% to 90% guaranteed) by our patented

WATER VAPORIZING ATTACHMENT.

We design, manufacture and erect Mills for Concentration and Amalgamation, Milling, Chlorination and Cyanide Processes. In writing for information, give us the analysis or character of the ore to be treated, to enable us to intelligently arrive at the proper method.

Our very complete catalogue of CRUSHING MACHINERY will be sent on application.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

CROWN GOLD MILLING CO.

To MINERS and MILLMEN.

If your ores are refractory; if you are losing concentratable values in your tailings; if your mines are in an arid district, or so situated as to make the introduction of water ruinously expensive; if you have large bodies of concentratable ores which could not be profitably treated hitherto,

THEN READ WHAT FOLLOWS:

The CROWN GOLD MILLING COMPANY'S concentrating machinery will concentrate any ores, sands or earths carrying metallic particles or metallic combinations of concentratable dimensions.

A shipping product of unexcelled purity is given, the greatest amount of concentratable values extracted, and a greater tonnage of ore is put into a ton of concentrates than by any other system of mechanical treatment. Every pound of ore delivered to machines is accounted for in the ore and concentrate bins.

It will cost you nothing to investigate, and may mean an increased profit on your ores, or a profit on bodies of ores which heretofore have failed to pay more than cost of treatment; or you may be enabled to make a productive property of a mine now idle.

We have a twenty-ton capacity plant in operation. All are invited to call and test it: from 1000 to 2000 pounds ore will be treated as a test. Charge \$20, to cover cost assays. Results at mine guaranteed to equal results obtained in testing. Wear and tear and labor cost guaranteed not to exceed cost by wet treatment of same character of ores.

Our machines are not for sale: they are placed on lease or royalty charge as may be agreed upon, and if results are not obtained as guaranteed no one loses but ourselves. Practice is better than theory: direct evidence is better than hearsay. All we ask of you is to come and be convinced that we have claimed less than we accomplish.

Office,.....230 Post St.

Time, Labor and Money Saved for Assayers.

Pat. applied for.

THE SIMPLEX ORE CRUSHER.

For crushing and pulverizing small quantities of ore by either hand or power. It is more easily operated than any other machine of its capacity on the market.

Its features are ease of opening for cleaning and simplicity of adjustment.

CALKINS' GYRATORY MULLER.

A recent invention for reducing crushed ore samples to a pulp. Will quickly pulverize to 100 mesh or finer.

Supersedes the slow and laborious Bucking Plate.

CALKINS' RADIAL BUCKING PLATE.

Designed to replace the old method of pulverizing crushed ore samples to a pulp of any desired fineness with but a fraction of the energy required to operate the old style Bucking Board and Muller.

THE IMPROVED BARTLETT CONCENTRATING TABLE.

The only table made that will take the place of jigs and do away with costly and complicated machinery.

Especially designed for separating zinc from lead.

Solid Iron Tops, planed to a true surface.

All parts are interchangeable.

Wearing parts reduced to a minimum.

Capacity from 15 to 45 tons in 24 hours, according to class of ore.

Our illustrated catalogue contains all the latest information on the concentration of ores. Mailed on application.

THE COLORADO IRON WORKS CO.,

Established 1860.

DENVER, COLO., U. S. A.

The "Stop for Repairs" to Mining Machinery,

Especially if it is a conveying plant, is a considerable item of expense. Many of these expensive pauses are made to repair or adjust faulty belting. To economize in this respect, use the

LEVIATHAN CONVEYOR BELT.

It is not only adapted to the heaviest service, but will run under any conditions in underground, drippings, extreme heat or cold.

IT WILL OUTLIVE ANY OTHER BELTING.

DRY PLACER MACHINES.

THE PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quick-silver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best **GOLD** saver in the world."

Capt. H. R. Gillingham, Cid., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

Is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape.

THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested by our own and our customers' experience during the past twenty years.

They are being used by more than nine-tenths of the prominent American engine builders, who are good judges of lubricators. Many of these have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use, or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our new catalogue, showing our full line, will be sent on application.

ASSESSMENT NOTICES.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of December, 1900, an assessment (No. 20) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 11th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 2nd day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
JOSEPH H. MOOSER, Secretary.
Office—320 Sansome street, room 24, San Francisco, California.

SILVER KING MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Pioneer Mining District, Plinal County, Arizona Territory.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of December, 1900, an assessment (No. 22) of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, Room 38, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 22d day of January, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 19th day of February, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
J. W. FBW, Secretary.
Office—310 Pine street, Room 38, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of December, 1900, an assessment (No. 23) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, 214 Pine street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 15th day of January, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 6th day of February, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
GEO. W. DIXON, Secretary.
Office—Room 31, 214 Pine street, San Francisco, California.

TANANA MINING COMPANY.—Location of principal place of business, San Francisco, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of December, A. D. 1900, an assessment (No. 2) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, Edward H. Stearns, at his office, Room 801 Claus Spreckels Building, Cor. Third and Market Sts., San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 6th day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
EDWARD H. STEARNS, Secretary.
Office—Room 801 Claus Spreckels Building, Cor. Third and Market Sts., San Francisco, California.

YUBA RIVER GOLD DREDGING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Smartsville, Yuba County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of January, 1901, an assessment (No. 2) of three cents (3 cents) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 214 Pine street, Room 23, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 9th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
ALBERT CERF, Secretary.
Office—No. 214 Pine street, Room 23, San Francisco, California.

DELINQUENT SALE NOTICE.

AMERICAN OIL AND REFINERY COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Contra Costa County, California.
Notice is hereby given, that there are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 26th day of November, 1900 the several amounts set opposite the names of the respective shareholders, as follows:

A MONEY-SAVING "HOIST"

Is the Weber Gasoline or Oil Hoist. Made right from right materials, in sizes from 6 to 150 H. P., with Single or Double Drum, for Gasoline, Gas or Distillate. Especially useful in mining, quarry, or ship use—good anywhere. State size wanted and for what purpose.

WEBER GAS & GASOLINE ENGINE CO.,

P. O. Box 1114-L, Kansas City, Mo.
See our PUMPING PLANTS.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge. Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ¼ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

San Francisco, Cal.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 850 Frue Vanners, one man attends 48 machines for 12-hour shift.

Technical Education.

In every technical journal technical education is being discussed. All concede its advantage, some claim more merit for it than the degree of value to which it is justly entitled, and others decry the methods of imparting it. While it is undoubtedly true that a student often leaves a technical school seriously handicapped by theories and ideas unaccompanied by practical knowledge, yet it is equally true that the embryo mining or electrical engineer or metallurgist can acquire directness of method, utility of time and knowledge of fundamental requirements better in a technical school or college course than he can in any other way.

The merits of American technical schools are manifest. As compared with similar European institutions, their results are at least equally satisfactory. They do not tend, as do many of the Old World technical institutions, to contemptuous feeling for the practical, and to a state that results in the commercial aspect of the case being despised by the professors. It was an English mathematician who is said to have thanked God that his science was one which could not be prostituted to any useful purpose. Prof. Adolf Slaby, a noted German authority on electro-technics, says: "Practical teaching is abhorred by the professors at most of our universities. I recollect attending a lecture by Helmholtz where I expected him to give some explanation of the dynamo. After making some theoretical observations, he merely said: 'Acting on these principles people have constructed some very ingenious machines called dynamos, for engineering purposes.' That was all Helmholtz would deign to say about the dynamo. The professors of to-day are just the same in this respect. Their teaching is purely scientific, philosophical, philological and historical and has not varied for three centuries." While Prof. Slaby exaggerates in the above statement, yet it is of common knowledge that many professors in colleges affect a disdain for anything beyond the domain of "pure science," or turning laboratory results to practical account. Still there are many bright men instructing in technical schools, as progressive and practical as the most advanced devotee of applied science could desire. The technical school has more virtues than faults and is an important factor in the nation's industrial progress. The ideal technical school would probably be one attached to a factory where young men could be systematically taught their business and the application of any department of science to their especial trade.

Improved Steam Appliances.

On this page are illustrated two patent steam appliances, one the Crane low water alarm, Fig. 1, the other, Fig. 2, the Crane blow-off valve. As long as the water does not go below the low water line, the water in tube B prevents the steam from reaching the fusible plug. The moment the water falls below the low water line, the steam will rush in and fuse the plug C, thereby allowing the steam to escape through the hole in the wheel, which raises lever D, opening valve in whistle F, thereby allowing steam in pipe E to give the alarm. To renew fusible plug, close valve G, unscrew nut C, and insert new gasket. Then replace nut C, allowing pipe B to cool before opening valve G. Then remove the key I, which indicates that valve G is open and ready for operation again. Valve J should be open only when testing. When testing, open valve J, allowing live steam to pass into pipe B, which will melt the gasket. This should be done once a month. In the blow-off valve the valve seat is outside, which prevents sediment lodging at this point. The projection on the under part of the disc prevents any discharge taking place until the seats have become widely separated, preventing wire drawing. This valve should always be connected from the pressure side.

TAOS, NEW MEXICO, is trying to have a miners' hospital. Several States and Territories have at times taken up this commendable idea in a vigorous way, and some have even gone so far as the State of California, which passed a law authorizing and legalizing such an institution, but so far no public hospital of that nature exists anywhere in this country, though there are several reasons why there should be such a State or Territorial institution in several of our mining commonwealths.

IN a recent issue editorial comment was made on the closeness of competitive bids on large electrical engineering contracts, as indicative of the exactness to which that science has attained, and figures were given in illustration showing that, in a work involving the expenditure of \$36,000, there was little comparative difference between the highest and lowest bids. From government reports to hand, it would not seem, however, that the same degree of exactitude was feasible in other forms of engineering work. In the case of the bids for raising the wreck of the Maine in the harbor of Havana, there were five bids, the lowest being \$80,000, the highest \$735,000—a notable discrepancy.

THE great dividend-producing capacity of mining investments makes it interesting to note where those dividends go. In California the best paying mining enterprise sends its dividends to London. Other of the mine dividend producers of the State also send their handsome surplus to non-resident stockholders. In Montana, of the hundred million dollars paid in dividends, not one million has gone to Montana residents. In Idaho the case is largely the same; likewise in Arizona. In Colorado nine-tenths of the dividends paid go to residents of that State. Cripple Creek district has paid \$18,000,000 in dividends. Of this, about \$16,000,000 goes to Colorado resident mining men. Colorado is to-day the most prosperous metal mining State in the nation. Why?

IN a recent issue of the Journal of the Association of Engineering Societies is an account of the use of a lead pipe siphon, of economic interest. It was put in use at Bar Harbor, Me., last April and at the time of the report had been in constant use without recharging and without waste of water. It has no air chamber nor pump, is 1 inch diameter and has wiped lead joints. Formerly a 2-inch galvanized pipe with screw joints had been used, but not satisfactorily, because of constant breaks in the siphon action. It is understood that the lead wiped joints constitute

the satisfactory improvement. It may also be assumed that the loss of head because of substitution of a 1-inch lead pipe for a 2-inch iron pipe was more than made up by the lesser friction due to the waste pipe discharge.

THERE seems to be as great an objection to some promoters' methods, on the part of Australian mining men, as exists in other parts of the world. At the last meeting of the Australasian Institute of Mining Engineers at Melbourne, the chairman, in the course of his remarks, said: "The great idea of many directly they got hold of a good property is to send it to London to be floated. This is generally done through some mining agent. Were it floated at £50,000 locally, every shilling, less brokerage and expenses, would go to the funds of the company; but in London the same company would be floated for £150,000, though no more working capital would be available. One property in Kalgoorlie, sold for £5000, was floated in London at £100,000, out of which only £20,000 ever reached the company itself." This almost equals the recent flotation of a Shasta county, Cal., copper property at \$6,000,000 that cost the Boston promoter thereof \$125,000.

THERE is a petition before the present California Legislature to take immediate and favorable action on additional appropriation this session of \$150,000 for the work planned by the California Debris Commission for impounding mining and other debris, to the end that similar appropriation may be made by the Federal Government therefor. Congress has already appropriated jointly \$250,000 with the State appropriation of equal amount. The United States Engineers' plans contemplate the expenditure of \$800,000; \$500,000 is available; \$300,000 more is needed. The whole matter has been gone over carefully, and in extensive detail. The measure has the endorsement of all concerned, its necessity is universally understood, and it constitutes a business proposition that will doubtless commend itself to the affirmative judgment of the California Legislature. It is not a favor asked for or to be granted to the miners. It is to supplement former appropriation for a manifest State need, and the entire subject is commended to the California Legislature as a most worthy one.

THE incipient trade with Russia is of importance to American manufacturers. Russia realizes the superiority of American-made machinery and gives promise of being a prominent purchaser. Under wise arrangement articles manufactured in this country are admitted free of duty to Vladivostok and other Asiatic ports of Siberia and Russia. During 1900 the United States sold to Russia over \$10,000,000 worth of manufactured goods direct. There is a present effort on the part of American beet sugar interests to prevent importation of that article from Russia by putting in force the Dingley tariff thereon. Such action would be unwise and would work hardship on American manufacturers with large quantities of incompleting Russian orders, for it is probable, should the Secretary of the Treasury enforce such import duty on beet sugar, Russia would retaliate by a duty of 25% or 30% on imports of American manufactures, which would be practically prohibitive, and tend to throttle the trade now growing. The \$10,000,000 of 1900 is but an index to the possibilities of increase therein. The total value of sugar imports from Russia during the fiscal year ending June 30, 1899, was but \$340,000. American manufacturers should take immediate action against this threatened check to their business by making such representation to the Secretary of the Treasury as will stay such prohibitive embargo.

A PARAGRAPH on page 48 of this issue takes the stand that success in managing a mine is largely to be measured by quick work in getting all its ore out. While this is not to be wholly gainsaid, yet there may be conveyed by the paragraph an erroneous idea. The quality of quickness is not inferior to that of thoroughness. It is not uncommon for a mine manager to make a record for quickness and cheap extraction of ore, the latter so phenomenal as to attract general attention, and yet, as a good mine worker such a manager is not always a success viewed from any standpoint. Indeed, viewed from

the base and sordid standpoint of financial profit, he may at times be a failure when the mine as an entirety is taken into consideration. A prominent mining manager in a letter to us on this very subject expresses the right idea. He is now managing a mine formerly operated by a superintendent who achieved a wonderful record for quickness and cheap extraction of ore. He says: "When one mines for the day only, and with no thought for the life of the mine beyond making a cheap record for cheap extraction, it is sometimes unsatisfactory for his successor," which is a mild way of intimating a good deal that might be said in connection with the paragraph, but which would be unnecessary to those who could understand it and useless to those who could not.

It is not uncommon for a prospector or experienced miner to honestly over-rate the value and extent of a copper prospect if he goes on the common belief that the discovery of ore presupposes the existence of a vein or continuous deposit. It is not unusual in California to find in probably fifty of its fifty-seven counties nodules of copper ore in limestone, serpentine, porphyry or schist formations; and while these little ore pockets naturally arouse hope of value in development, yet it is often the case that the most promising surface indications in that regard prove delusive. In one example of such circumstance—the Copper World claim, near Ivanpah, Cal.—there was an ore exposure, solely limestone with infiltrated iron and copper oxides, carrying 6% copper in one part of the claim; in another part ore of better quality was found scattered over a surface area of 80x250 feet, and the apparently well-founded justification for extensive development work occasioned the expenditure of considerable money. This is a type of similar instances in various parts of the Pacific Coast. Sometimes such prospects have afforded ground-work for the most plausible prospectuses issued by promoters of companies, the more plausible and specious because so much regarding merit and value could be truthfully said. Where a mining engineer can say without deviating from the exact facts that there are 10,000 tons of chalcopryite outcrop averaging 10% copper in a property under discussion, it gives good ground for the promoter to do some fancy figuring that could serve meretricious purpose with unthinking observers. In these days of extensive copper research and expansive copper promotions it is no harm to bear those facts in mind.

FROM Mr. Seligman, the Guggenheims' financial agent, is learned that the absorption of the Guggenheim smelting plants by the American Smelting & Refining Co. has at last been accomplished. Colorado advices regarding the big deal are to the effect that there will be considerable change in administrative and executive methods, some of which are in accordance with the terms of agreement, and others resulting from the logical carrying out of the same principles that suggest or justify the entire system of consolidation. It is asserted that the abolishment of general managers of the several plants has been decided upon, and that instead each smelter is to have a superintendent, who is to report to headquarters at Denver to J. B. Grant, chairman of the operating board. The idea of such abolishment of the several managers is figured to save about \$250,000 annually, and the credit or the onus of such policy is given to the Guggenheims, who are announced to have insisted upon such policy as an essential part of the terms by which they agreed to be absorbed by the trust. It is also intimated that other decapitations will follow, to the extent of making a total annual saving of salaries to the amount of \$500,000. This policy had already been determined upon, and the pooling of the Guggenheims furnishes a convenient time in which to make it effective. Daniel Guggenheim will be chairman of the board of directors, with headquarters in New York City; E. W. Nash of Omaha, Neb., will continue to be president of the company. With the exception of some sporadic concerns in Colorado, this aggregation takes in nearly all the custom smelters of any magnitude except those on the Pacific coast. The latter will continue to operate independently. It is understood that the Guggenheims are given 35% of the \$100,000,000 capitalization of the company.

Concentrates.

WATER at 60° F. weighs 62.5 pounds per cubic foot; at 150° F., 61.16 pounds per cubic foot.

THE one billionth minute since the beginning of our present system of chronology will be reached at 10:40 A. M. April 30, 1902.

TO lubricate the cylinder of the gas engine try finely pulverized graphite fed into the cylinder through the suction pipe with the air and gas.

FINE wire cloth will help in making a lasting steam-tight joint with putty or rubber. It helps to hold the material together, preventing its being blown out.

WITH a well proportioned charge of gas and air, and a well ventilated mine, the fumes from the exhaust of a gas engine should not constitute a serious detriment to its use.

TO HARDEN a steel tool for a special purpose, heat it to a cherry red, drive the point into a cake of lead, and leave it there until it is cold. It will prove to be hard and tough.

WITH dry bituminous coal the chimney gases in case of perfect combustion would be by weight: nitrogen, 70.7; carbonic acid, 25.6; water, 3.7; by volume, 79, 18 and 3, respectively.

THERE is a California law that corporations therein shall have monthly pay days for employes, but was held to be unconstitutional in the case of Johnson vs. Good-year Mining Co., 127 Cal., page 4.

THE largest square that can be got out of a round piece of metal is found by multiplying the diameter by .7071. From a disc 1½ inches diameter could be cut a square piece .8838 inch in diameter.

MANGANESE BRONZE in the form of sheets, for mining screens, is sometimes used, acid mine waters having no action on it. For rolling into sheets a mixture containing more copper and less manganese is now employed.

THE whole matter of petroleum in California was the subject of specially written articles thereon by experts, illustrated with original engravings, in the issues of 1899 and 1900. A limited number of any issue can be furnished on request.

THE whole science of balancing is founded on the axiom in dynamics that no motion of mass can occur without a compensating motion of mass in an opposite direction, so that the common center of gravity shall remain undisturbed.

ACCORDING to the decision of the International Congress of Electricians which met at Chicago in 1893, the ampere, or unit current, is one which deposits silver from a solution of a silver salt at the rate of 0.001118 grammes per second.

WHERE the cylinder of a gas engine is 4 inches in diameter, and the stroke 5 inches, the nominal horse power is 2½. A Corliss engine, cylinder 22 inches, stroke 42 inches, ninety revolutions per minute, boiler pressure ninety pounds per square inch, is capable of evolving under those conditions 380 H. P.

THERE is a Federal Court decision to the effect that, though the stakes and monuments as designated in a notice locating a mining claim were not visible at the time of a subsequent relocation, such fact does not vitiate the former location, if the law in all other essential requirements has been complied with.

TEMPERING of steel can be done in two ways: one by hardening it first on plunging into cold water and then drawing the temper, and the other by plunging the red hot steel into various liquids directly. The temperature of such fluids and their capacities of drawing off heat regulate the degree of temper obtained.

"CONCENTRATES" does not presume to discuss mining or scientific matters with new process men, promoters or other superior informed people, but attempts earnest effort to answer any question in its domain likely to be of practical value to the inquirer, though the effort to do so answer such question may be unsuccessful or unsatisfactory.

THE temperature of battery water has been so exhaustively discussed herein that nothing could now be said new that would be good, or good that would be new. The sensitive qualities of mercury which make it available in amalgamation remain unchanged between ordinary points of temperature, and the degree thereof is not so important as its uniformity.

THE effect of the Caminetti law passed by Congress March 1, 1893, relative to hydraulic mining in California, is to prohibit such mining within the designated territory till the California Debris Commission determines if it can be resumed without material detriment to navigation. This it does upon petition and inquiry in each individual case officially brought to its attention.

AT Cripple Creek, Colorado, the miner may go up to his work from the town on an electric car, go down in the mine by an electric hoist, operated by electric signals, the shaft being kept dry by an electric pump, do his work by an electric light, talk to the town and thence to the world by an electric telephone, run a drill electrically operated, and fire his shots by an electric blaster.

THE distance from the equator to the north pole, measured on the sea level along the meridian that passes through Paris, was carefully surveyed, and when accurately determined was divided by 10,000,000. The result

was found to be 39.37006 inches—39½ inches for all practical purposes. A bar of platinum was made exactly the required length, as this metal is affected but little by changes of temperature, and deposited in the archives at Paris, to be preserved as a standard measure.

THE question as to whether in Colorado a mechanic's lien will lie for articles furnished for a smelting plant depends to a considerable extent upon the intention of the owner to make them a permanent accession to the plant, and upon the use to which they were applied, which matters could only be determined by a detailed and accurate statement of all the facts on both sides.

A SUBSTITUTE for German silver can be made by the use of manganese, the different metals and their proportions being as follows: 67.25 copper, 18.50 manganese, 13.00 zinc and 1.25 aluminum. The color of the metal produced by this amalgamation is good for the uses to which it is put and resembles the article known by that name; it is said to be as strong as the German silver and has equal casting quality.

ELECTRICAL RESISTANCE may be defined as that property of a conductor which determines how much heat a given current will produce in a given time. If the heat be measured in calories, the current in amperes, and the time in seconds, the resistance may be found by:

$R = \frac{4.2 H}{C^2 t}$ R = resistance in ohms; H = heat generated in the conductor; C = current in amperes; t = time in seconds.

STEAM, eighty pounds gauge (94.7 absolute), has at sea level a temperature of about 323.56° F., the atmospheric pressure being 14.7 pounds per square inch. At an altitude of 11,000 feet, the atmospheric pressure is 9.8 pounds per square inch, barometer 20 inches, and steam at eighty pounds gauge (89.8 pounds absolute) would have a temperature of 318.86° F.; hence, at the mine at Sierra Blanca, Colo., proportionately less heat would be required to obtain steam at eighty pounds gauge pressure than at sea level.

GRAPHITE is used for many manufactures in its natural impure state. It is purified for other uses by first being ground or otherwise reduced to a state of fine subdivision. The next operations are washing out the heavier impurities, mixing fourteen parts with one part of potassium chlorate and two parts of concentrated sulphuric acid, heating on a water-bath for some hours, washing thoroughly and afterwards roasting at a red heat. If silica is present a treatment with hydrofluoric acid is added to the process.

TREATMENT of gold ores with a weak solution of cyanide of potassium was known in 1866. Volume XLI of the American Journal of Science, 1866, page 222, contains a paragraph in a letter written by Dr. Henry Wurtz, wherein he distinctly mentions the obtaining of gold in solution by the action of cyanide of potassium. As far back as 1843 Prince Pierre Bagration described in the Bulletin de l'Academie des Sciences de St. Petersburg some experiments with finely divided gold dissolved in "an aqueous solution of potassium cyanide," in which he "succeeded in precipitating the precious metal."

THE leather can be fixed so firmly to the metal that the former can not be separated from the latter without tearing: Intimately mix one part by weight of coarsely crushed gall nuts with eight parts by weight of distilled water for about six hours, and filter through linen. Prepare a concentrated glue solution by pouring one part by weight of cold water over one part by weight of glue; let that stand for twenty-four hours; then heat the solution, coat the leather with the warm gall nut extract, put the glue as prepared on the roughened and warmed metal, lay the leather on it, press firmly, allow to dry in the air.

SPIEGELEISEN and ferro-manganese are both used in making steel; the difference between them is mostly in grade. Spiegeleisen is pig iron containing varying proportions of manganese up to 30%, usually between 20% and 30%. Pig iron containing from 30% to 60% manganese is low-grade ferro-manganese and over 60% Mn, high-grade ferro-manganese. The usual commercial standard for high-grade ferro. is 80%, and it is quoted on that basis. The usual commercial standard for manganese ores is 50% metallic manganese. Some large steel companies take ores as low as 40% as manganese ores. Most of the ore imported runs about 50%.

IN telephonic communication, the sound waves produced by the voice of the speaker cause the diaphragm of the transmitter to vibrate. The vibrations have the same period as the waves of the voice. The vibrations of the diaphragm cause the electric current through the line to vary in the same periods. The variation of the electric current sets the diaphragm of the receiver into vibration, and this vibration is received by the ear of the listener as sound. The voice is not transmitted. A current of electricity is transmitted through the line. A voice can not be heard a long distance. It is noticeable that the vibrations of the diaphragm of the receiver reproduce the qualities of the voice of the person speaking so perfectly that the person can usually be recognized by the reproduced tones.

THE crushing power of a stamp depends partly on its weight, and, further, on its momentum. There is a narrow limit for the height of drop of heavy stamps. As shown in last week's issue, a lighter stamp with higher drop will acquire a momentum that will entail equal crushing capacity. There is greater flexibility in the adjustment of a stamp battery that has a range of 4

inches in drop than in one where there is a range of only 1½ to 2 inches. While there are many individual cases where great weight is desirable, the working conditions of a battery with stamps of over 1000 pounds are limited, and the mill man is correspondingly restricted. As in everything else connected with the treatment of gold ores, each case needs special experiment and adaptation. As a general rule, however, if any mistake be made 'tis better to have the stamp too light than too heavy.

TO CALCULATE the power of a gas engine, let D represent the diameter of the cylinder in inches; L the length of the stroke in inches; R the revolutions per minute of the crank shaft; H the delivered or brake horse power of the engine. Then for a two-cycle engine the formula would be: $H = \frac{D^2 \times L \times R}{13,500}$. For a four-cycle engine the

formula would be: $H = \frac{D^2 \times L \times R}{18,000}$. That is, multiply

together the square of the cylinder diameter, the length of the stroke, and the speed in revolutions per minute; divide the product by 18,000 to obtain the horse power of a four-cycle engine, and by 13,500 to get the horse power of a two-cycle engine. Our inquirer must, however, bear in mind the difference between indicated and actual horse power.

CONCERNING the right of a gold dredger to operate in a river bed, in the case of a navigable river within the limits of any State the shores and bed thereof belong to that State, together with the contents. It is not to be assumed that any form of gold dredging in river beds would hinder navigation; indeed, there are gold dredgers on the Feather river, Cal., that are aiding in scouring the channel and making better the condition of that river, so far as navigability is concerned, but as against the State the gold dredger has no rights anywhere except by private purchase or legal placer location. Meanwhile, unless restrained by the State, he can operate, and in the absence of such State injunction or restraint he can act as does the fisherman. Of course, no one contemplating any extensive outlay would take any chances, the right to peaceful possession of the ground being as essential in this as in any other form of gold mining.

A VERY small amount of copper ore near the surface of a rock is able to stain it for yards by its carbonates and oxides. So, too, fissures in sandstone may have a vein of copper ore a few inches wide, and yet the walls on either side will become impregnated to such a distance that the first-sight observer would imagine he had a really valuable find. Absolute dependence cannot be placed upon the surface signs of the presence of copper-bearing ore, even where there is a heavy cap of iron oxide more or less spongy or honeycombed, and showing streaks of green carbonate of copper. At a little depth solid masses of green malachite and blue azurite may appear mingled, perhaps, with flakes of native copper and various oxides, such as black oxide, red oxide or cuprite, and copper glance. Where the ore or the enclosing rock is of a siliceous character, a turquoise bluish-green silicate of copper may occur, harder and of a different shade of green from the copper carbonate or malachite.

IN the case of Wilson vs. Triumph Con. M. Co., 56 Pacific Reporter, 300, the Utah Supreme Court decided that where a mining claim is located by an alien on unappropriated Government land, and all the acts necessary to a valid location are performed by him, and he and his representatives, claiming to be owners of same, perform the work necessary to keep the claim good until it is conveyed to a citizen, and no rights of third parties have attached prior to the conveyance, as between private citizens, the conveyance vests the title in the citizen, although the original locator was an alien. A qualified elector may relocate a mining claim in the possession of an alien who has not declared his intention to become a citizen, if relocation be made without force or violence, and prior to declaration of intention or conveyance to a citizen. Since the question whether the locator of a mining claim is a citizen of the United States can only be raised by the Government, it cannot be raised in an action of ejectment in a contest between individuals.

WHILE lightning may be seen and its illumination of clouds and mist recognized when even 200 miles distant, thunder is rarely audible more than 10 miles. The thunder from distant storms, therefore, seldom reaches the ear. The audibility of thunder depends not only on the initial intensity of the crash, but on the surroundings of the observer, even as in the quiet country one will observe feeble sounds that escape the ear in a noisy city. One curious and important condition of audibility is that the thunder wave of sound shall not be refracted or reflected by layers of warm and cold air between the observer and the lightning or by layers of wind, swift above and slow below, so as to entirely pass over or around the observer. Sound, in its wave-like progress obliquely through layers of air of different densities, is subject to refraction, and this refraction may occur at any time and place. Thus, observers at the topmast of a ship frequently hear fog whistles that are inaudible at sea level; those on hilltops hear thunder that cannot be heard in the valley; those in front of an obstacle hear sounds inaudible to those behind it. The rolling of thunder, like that of a distant cannonade, may be largely due to special reflections and refractions of sound. Again, the greater velocity of the air at considerable altitude above the ground distorts the sound wave and shortens the audibility to leeward, while increasing it to the windward.

Mining in the Philippines.

Written for the MINING AND SCIENTIFIC PRESS.

There is considerable mineral wealth in the Philippine Islands. The writer visited the principal mining districts recently and observed that most of the mines were in operation and on a paying basis. There are mines in operation in which various descriptions of ores are taken out in quantities varying from small lots, as handled by individuals, to the wholesale output of the mining companies and corporations. When the Americans first took possession of the islands, most of the mining was done on a crude and limited scale. Numbers of individual prospectors were in the field, and these men had considerable trouble in getting even small specimens of rich ores. There were many rebels, ladrones and cutthroats in and about the mining regions, and many a small mining party was cut off, killed and their properties looted. The remains of numerous mining huts can be found in the hills, and, if one takes the trouble to search the jungle in the vicinity, he will usually find the bones of one or more of the first miners of the islands, who were so unfortunate as to come here when there were few garrisons established and numerous guerrillas in the mountains. There may be some of the hidden treasure of the party found which escaped the notice of the thieves, and your correspondent has record of several instances in which little bags of gold, silver or other precious metal have been discovered in the soil or some rocky crevice near the ruins of a once busy mining camp. The mining of today is conducted with safety, however, for the American soldiers are distributed liberally over all of the islands, especially in the districts where there are many Americans or other foreigners working at the mines, plantations, forests or sugar mills. Then, in addition to the soldiery, there are the native forces of scouts, enlisted by the Government for the purpose of doing guard and patrol duty, identifying suspects, carrying messages and routing the freebooters of the country. These native soldiers are under the command of American officers and non-commissioned officers, and are posted in and about the mining districts for the protection of miners and properties. Local native police—from 25 to 100—are stationed in nearly every mountain mining town, and these aid in the preservation of peace and order. The native scouts and police are all new institutions, and with their aid the miner is fairly well protected from the ladrones. If it were not for these protections, mining would be unsafe here, as it was previous to American occupation. At the present time there are many miners and mining concerns with capital at work in the hills, and, from all reports available at the present writing, most are making a good thing out of it, considerable ore coming in.

A large percentage of the gold and silver taken out of the Philippine mines is used in this country, for the people are very fond of jewelry, and the jewelers and makers of trinkets are all busy manufacturing various patterns of ornaments. Much of the gold, silver, copper and other ores are sent to the agencies in Manila, whence they are packed properly and shipped to foreign markets.

Gold, silver, copper, lead and zinc are being taken out of the mines on the islands of Luzon, Mindanao, Panay, Gimeras, Negros and Cebu. The Spaniards operated many mines for years previous to the occupation of the islands by the Americans, but they did not go to work in the right way. Your correspondent visited many of the mines on Luzon, Panay and Mindanao, which were once worked by the Spaniards, and found that the operations had been abandoned because of improper management. At first the miners were able to pick up considerable yellow metal on the surface. Also, the sands of the beaches produced finer gold dust, because of having been washed there through some river passing through the foothills of a mountainous section in which gold deposits existed.

But this sort of mining did not last; it was necessary to put in shafts; native labor was hired, and native labor can not always be relied upon for steady work. The better way was to hire the Chinese coolies, for there are two or three millions in the islands willing to work at from 10 to 12 cents per day in the mines or on farms, and these fellows can be relied on to work steadily. The natives have a habit of quitting work when they have made a little money and loafing until they need more. Besides getting gold and other of the higher grades of metals from the mines of these islands, iron and coal are taken out.

The condition of a country as regards roads always interests miners, especially a country in which the possibilities for mining are unknown. The roads have altered much during the past two years. When the writer first arrived here the roads were in very bad condition—hardly anything better than trails in the mountains—while the roads on the flat and low country were mud holes in the rainy season and in the dry season were so rough and dusty that traffic was carried on only with difficulty. The roads of the country have been worked upon by native prisoners for the past eighteen months with such good results that it is now possible for mining companies to make some headway. The companies for the first period of their

existence used a good deal of their capital in the making of passageways through the jungle to connect with the main roads. Then, again, much money was spent in making rafts with which to ford the rivers, and, in some cases where the currents were strong, bridges had to be erected. Only the richer concerns were able to stand costs of this kind, so that in many instances the ores were carried from the mines to the sea coast by pack animals or by means of little bamboo drag sleds hauled by bulls, horses or caribou. In some instances the ores were moved by means of baskets, each one suspended to a pole placed across the shoulders of natives. The miners had to suffer many losses through the imperfect road system of the country, and for a time the expense of transportation consumed all of the profits and in fact caused numbers of the mines to be closed.

A system of internal revenue taxes has been in vogue in the islands for several months, and the income from these taxes is being utilized in the building of proper roads, repair and construction of the bridges and arranging for the traffic of freight across the islands. There is a large amount of sandstone and lime used in the construction work, and some of the lime quarries are paying well; they may be found in the interior of Panay and other islands in large numbers. I went through one section of Panay island in which there were hundreds of carts at work hauling to the seaport and for road work immense quantities of white limestone taken from the shafts cut into the sides of the hills. The natives work in these shafts, cutting out chunks of lime rock. Then there are the so-called sandstone mines, in which there are great mountains of this rock, which is soft, can be cut readily and shaped into cubes or slabs for transportation, but which is most excellent material for the building of roadbeds and for bridge work. In addition to the large numbers of persons and animals employed on the roads and hired with money from the tax collections, there are several thousand native prisoners, taken in battle with the Americans, who are working on the roads, thus serving out their sentences. These prisoners were not formerly all soldiers of the Philippine army, but were of the ladrones and outlaw classes, of which there were large tribes roaming over the islands, looting, killing and burning for a living. These large bands have been captured or broken up and the remnants put to work on the roads and bridges. All this road work is useful to the miners, for heretofore transportation of the output of the mines in many places was so hard that it did not pay to work the mines. I notice that several of the largest and best paying mines have been started recently as the result of the opening of new roads and the repair of some of the older ones.

The docks of the Philippines, except in the immediate vicinity of Manila, Iloilo and one or two other of the larger places, have never been in fit condition for service, and the miners have suffered severe losses as a result. The docks are either in ruins in many of the ports, due to neglect or long service, or there are no docks at all. Wharfage is scarce, and many a mining town which might be prosperous is quiet because of the lack of means for shipping ores. About a month ago, however, the famous harbor bill for the Philippines was passed, and now that there are about \$1,000,000 available for the erection of wharves at needed points, it is reasonable to suppose that it will not be long before some of these deserted towns will flourish as soon as the mining operations begin. There is great difficulty experienced in landing native boats, especially in rough weather, and as only the low, flat beaches are found in many places, the difficulty in getting ore aboard is very great. I observed that in many of the seaport towns the basket carriers or the sleds drawn by cattle, loaded with ores from the mining towns in the hills, were brought to the water's edge and there loaded upon bamboo rafts. The natives would then paddle the raft out half a mile to a native boat and there effect the loading. This can be done only in good weather, for when the water is rough much of the ore is washed overboard from the rafts and lost. The establishment of dockage, however, will aid in getting the ore on the little native vessels and be of assistance to the miners.

Miners can not come into the mining sections of the Philippines and expect to find railroads in operation, as is the case in the principal mining districts of America. On the island of Luzon there are several lines of railroads, some of which tap the mining sections, but which are mostly arranged to reach the cocoanut districts, for the transportation of the cocoanut in the copra season is most profitable to the roads. On the island of Panay there is a little narrow-gauge railroad in ruins in the interior, built by the Spanish for moving iron ores. This road could be put into running order for a few thousand dollars. Some parts of the road merely require a little ballast. I saw several ore cars in perfect shape, except very rusty and soiled, dumped down alongside the road where they had been pushed, and there left to rot. Like everything bearing the Spanish mark, the road is going to ruins. Probably the road was first abandoned because some of the rails worked loose. The Spanish and the natives do not believe in making repairs. I have seen bridges closed to traffic because of a few planks having broken or rotted,

and the public takes to the river, fording it. Men and women cross the river by wading or by a raft. If a piece of roadway is washed out, it will remain out of repairs for months before it is fixed. But there are Americans now in the islands, and some of these people see money in railroads for the commercial and mining sections. I have met with several representatives of rich American railroad corporations who propose to establish roads here in the near future. Certainly the roads will pay handsome dividends. The miner of the future may depend upon having railroads for transportation purposes; but for the present the native carts and native basket carriers must be depended upon.

The woods of the country, of course, concern the miner to some extent, for there are shafts to be built and protected, buildings to be constructed and other lines of work done requiring the products of the forests. There are immense tracts of land here covered with all descriptions of hard woods, and, as most of the forest lands are now Government property, the miner can secure all the timber he desires at the mere cost of hauling. I visited several woody sections in company with a mining engineer, and was surprised at the high-grade woods available. I saw that the men were selecting immense mahogany trees and using some of the timber for mining purposes, this being especially adaptable for certain work that the engineer had in view. He told me that it was as easy and as cheap to get mahogany as pine. In fact, pine is scarcer than the former. All of the soft woods are harder to find than the hard woods. Black walnut, ash and other woods are cut into large planks by hand, the natives doing the work, which is seemingly a costly way; but it is the only way, as there are no circular saws in operation in the Philippines, except in a few sawmills near Manila. The native wood sawyers work for 15 cents per day, which, of course, makes the cost of labor low. There is a great chance here for some of the miners to put in lumber mills. The most inferior equipped lumber mill would pay a fortune here in a year. Everyone wants lumber, but can not get it, except the hand-cut sort, and one may judge what sort of cutting can be had when immense boards are sawed out by hand. The work is sure to be irregular and unsatisfactory. Then there are great delays in getting the boards, as it takes nearly all day to saw out one of the big ones. With the immense forests of wood available, and the great demand for lumber for mining and building purposes, a mining corporation would make considerable of an income by running an American equipped sawmill in connection with its regular line of business.

The work in the mines of the Philippines is greatly handicapped in consequence of the lack of proper machinery. The Spaniards tried to do some mining, and they failed in most cases because they lacked the necessary machinery. The miners who are operating in the hills at the present time are handicapped by having no proper outfits for carrying on the work as it should be done. The days of placer mining for gold are over, for the natives have always followed this line of work and have kept the hills thoroughly cleaned up. There is much to be done in quartz mining, and in the sections where they have crushing machinery the miners are doing well. All of them did not bring apparatus, however, and the result is that some of the mines are tied up. It is very difficult to secure the desired mining machinery at Manila or at Iloilo, where machinery and steam goods supply houses have been established, in which one can buy engines and boilers, ventilators, conveying machinery, oils, belts, water wheels and general mining tools; but the heavier and more costly equipments, such as crushers, concentrators, stamp mills and the like, are not to be had. In some cases the mining concerns have made attempts to operate foundries in which to cast the necessary gearing and framework for the making of the needed machines. I saw some of these homemade devices, and the castings were full of sand and blowholes, and the fittings were heating and grinding, regardless of being deluged in oil. The shafts, which were forged or taken from the ruins of sugar mills which had been burned by the insurgents, were warped and cracked, couplings failed to join evenly, and all of the machines thus made, as seen by your correspondent, failed to accomplish the work for which they were erected and had to be abandoned. There will in time be mining machinery houses in the islands, but for the present mining concerns should see to it that their orders for the required machinery are filled in the United States.

ENGINEER.

Iloilo, Isle de Panay, P. I., Dec 1, 1900.

THE notable success as managers of American mining men over mining men of other countries is in quickly and successfully solving the problem. Given a certain amount of money locked up in a certain piece of ground, how can that money be extracted in the shortest possible time at the cheapest cost? A mine is nothing more nor less than a certain amount of money locked up in earthy material; the more quickly that money can be taken out the less interest will have to be paid on the capital invested in taking it out, and the sooner the profits realized can be turned into interest-bearing sums. It follows logically that the more quickly a mine is developed the sooner extraction can be begun.—Engineering Magazine.

Centre Star Mining Co.'s Report.

Through the courtesy of Mr. E. B. Kirby, the manager, is received the recently compiled report of operations in the Centre Star mine, Rossland, B. C., which gives some detailed information of general value. The following statement shows values and smelter charges per ton for year ending—

	Sept. 30th, 1899.	Sept. 30th, 1900.
Real or full assay value—total metallic contents at full N. Y. quotations....	\$22 84	\$20 14
Indirect smelting charge—difference between N. Y. quotations and smelter's prices for the metals.....	3 93	3 57
Direct smelting charge—including freight from the mine.....	6 00	6 00
Total smelting charge—direct and indirect.....	9 93	9 57
Smelter's gross assay value—after deducting indirect charges only.....	18 91	12 91
Smelter's net value—after deducting both the indirect and direct charges from the real assay value (i. e. net value of ore f. o. b. cars at mine)....	12 21	10 57

On Feb. 6, 1900, the mine closed down to permit the installation of new machinery. Mr. Kirby says: "It was decided to take advantage of the opportunity afforded by the stoppage to make a radical change in the method of employing labor. The costs of mining during the preceding year were very excessive, and it had long been apparent that the principal cause of this unusual expense was due to the inefficiency of wage labor under the conditions prevailing in Rossland. The quantity of work done per man for the wages paid was not satisfactory. Repeated efforts had shown that it was impossible to make any satisfactory improvement under this system, and it was therefore decided to introduce the contract system, whereby miners would be paid according to the quantity of work performed, instead of by the time spent in doing it. On March 12th this system was presented to the employees of the Centre Star, War Eagle and Le Roi mines. At first many of the miners opposed the change, fearing that it would be injurious to their interests. The issue remained unsettled for several weeks, during which the mines were closed. On April 5th the question was settled amicably with the miners, who decided in favor of adopting the new arrangement proposed. As the new system had to be inaugurated by degrees, it was some time before the development headings were fairly under way. "The reduction of costs effected by the contract system will appear in the cost sheet for the coming year. It does not show in the table of average costs for the past year. These are excessive, because most of the work represented there was done under the old wages system. Moreover, it includes the fixed and general expenses during a more or less complete stoppage of nearly three months, and a subsequent period during which little ore was produced. The results of the new system are now clearly established by the work of several months, and the improvement shown is even in excess of what was expected. "In shaft sinking, 129 feet of contract work compared with the last 100 feet under the wages system, shows that the average rate of advance has been increased from 23½ feet per month to a present rate of 47½ feet per month. The cost of drilling, blasting, shoveling and timbering shows a reduction from \$65.30 per foot of advance to \$44.30 per foot. This comparison is on a basis of three shifts (twelve men) daily, and a thirty-day month. "In drifting, the rate of advance for headings has been increased from the former average of 52 feet per month by the wages system to the present average of 94 feet per month by contract. The compari-

son is on the basis of two shifts (four men) daily, per heading, and a thirty-day month. The cost of drilling and blasting shows a reduction from \$8.03 per foot of advance to \$5.41 per foot. "In stoping, by contract the average ore broken per man per shift for the month of September is 14.4 tons. The former average, under the wages system, was 4.3 tons. The cost of drilling, blasting and explosives for the same period was 37 cents per ton of ore broken, against a former average of 94 cents per ton under the old system. "The results of the new system have been equally satisfactory to the contractors, who have averaged good pay, considerably above the standard rate of daily wages."

Mother Lode, Cal., Mining Methods.*

The timbers employed in the mines of the Central Lode are uniformly large—18 to 30 inches in diameter—and the method of framing and placing them varies somewhat, but is usually, in the larger stopes, some modification of the system known throughout the world as the Nevada square-set. The placing of these timbers is accomplished often under great disadvantage, and, in some instances, with considerable evident danger. The men selected for this work usually represent the finest type of physical manhood, for no others could accomplish the arduous task expeditiously. As to the relative merits of the respective methods of framing these heavy timbers, it seems only necessary to say that those systems involving the least framing with ax and adz underground, and consequent smaller loss of time in placing timbers in position, are the methods best adapted to regular practice.

In some mines an objection is raised to the employment of sills on the main floor of a level, for the reason that the sills rot before the stopes can be carried through from any level to the next above. In most cases there is no excuse for this. A reprehensible practice, which is found almost universal in these mines, is that of attempting to carry up stopes of too large a superficial area, and this practice is responsible for some disastrous caves which have occurred in various mines. A stope of smaller superficial area can generally be carried from one level to the next above more quickly and safely than a large one, and in most cases, even by the present old-fashioned methods of mining, a stope of small sectional area may be carried through in a few months—long before the sills become weakened by reason of decay. If the development of the mine were carried on well in advance of the extraction of the ore, it would not be found necessary to open these large stopes, as a number of smaller stopes would supply the same amount of ore daily as is usually drawn from one, two or three large stopes, and it would be found that ultimately the cost would be materially less, as in most cases there would be no loss of ore, no disastrous caves, and work could be accomplished more expeditiously and more cheaply.

FILLING.—There are few veins on the Central Lode where, by present mining methods, filling is not absolutely necessary, though by the adoption of the lateral foot wall gangway system heretofore suggested, in some of the smaller mines, filling might to some extent be dispensed with, the walls being allowed to collapse after removing the ore. Material for filling is usually obtained from crosscuts and drifts driven in prospecting, and from chambers cut in the walls of the veins—generally the hanging wall. There are few veins on the lode so small as to make enough waste in stoping to fill the excavation. Ordinarily, all the rock removed from the pay shoot goes to the mill, and filling must be obtained elsewhere. In some of the larger mines, where the veins are of great

size—40 to 100 feet or more in width—it is not uncommon to find the entire vein removed for a distance along its strike equal to and often much greater than its width, the entire area overhead resting upon the props reaching from the topmost set of timbers to the roof. There may be three, four or more floors in place, and the stope may be found filled from the sill floor to within a floor or two from the top; but it is clearly evident that in a stope of the size indicated this filling can afford but little if any support to the hanging wall, and none at all to the back of the stope. Failure to recognize this fact has resulted disastrously in more than one mine. The filling must be placed in such manner as to support the back of the stope over as large an area as possible, and a portion of this filling at least must be placed by hand, for it is clearly evident that should any subsidence occur in a stope approximating 100 feet square timbers cannot be depended on to support the great weight. In a stope having a width and length of 100 feet, and carried up four floors in height, there would remain between the top set and the floor of the level next above (65 feet) not less than 50,000 tons of ore. Should this become "dead weight," each post of the sets in place would have to sustain a load of several hundred tons of ore in addition to the weight coming from ore and filling in levels above, and to this must be added the greater pressure coming from the direction of the hanging wall. This weight, or pressure, will vary greatly in different mines, depending upon the character of the ground, the condition of the walls, and to no small extent upon the angle of dip of the vein. Were the enormous weight of this great shifting mass of rock equally distributed, there would be less probability of a cave; but often, the weight being transferred from point to point, owing to the mobility of the ground, the pressure upon some given point becomes greater than the timbers can sustain, and a single line of sets once forced out of position renders the remaining sets less secure than before, and general collapse results; and most miners are familiar with the dangers and extraordinary expense incident to the recovery of a caved stope and the extraction of the shattered masses of ore from the zone above the cave. In veins having vertical walls the danger of caves is much lessened, but the mines of the California gold belt dip at all angles ranging between 30° and 85°, the greater number being between 45° and 70°, below the plane of the horizon. This being the case, the pressure upon timber sets is exerted diagonally, and not directly downward upon the posts of the sets. Naturally this renders the square, or rectangular, sets less capable of sustaining the weight and pressure. In some mines diagonal braces are set in to take this hanging wall pressure more directly, but timber will not hold it.

In consideration of the above facts, the absolute necessity of filling becomes apparent, and the necessary preparation to this end should always be promptly made in order that the filling of the stopes be not too long delayed. Filling must be carried on contemporaneously with ore extraction; and in stoping the excavation should be carried upward in sections of relatively small superficial area, the filling being packed as close to the back of the stope as possible. Where the veins do not greatly exceed 15 feet in width, the conditions are essentially changed, as in such cases the stopes may be timbered with stulls set slightly above a right angle to the dip of the walls. Most mines, where the walls are sufficiently firm, are timbered in this manner when the distance between walls admits it.

The Bulletin here refers to the method of stoping and filling adopted by Supt. Uren at the Eagle-Shawmut mine, Tuolumne county, Cal. His plan is to put a long raise to the surface from a point above the tunnel level. This raise is driven at an angle of about 65° above the horizon, the slope being westerly. The formation and veins dip easterly at about 70°. The walls are usually firm and hard. The incline above mentioned reaches the surface in an open cut, where the rock, being barren, is suited for filling, and may be quarried cheaply. Stopes are started and mining operations continued by cutting out the ground the full width of the vein in the form of the letter A, the base being longitudinally of the vein and the angle at the apex being no less than 90° in order that the rock may readily run on the slope. The floor of this stope is heavily studded and covered with lagging. The winze passes directly through the apex of this triangular stope, and waste is sent down from the surface and the excavation filled. Stoping then progresses in slices on alternate sides of the winze or raise. These slices are from 15 to 20 feet in height, the pay rock passing down through mill holes cut through from the level below, the ore chutes being carried up by cribbing, keeping even with stoping operations, and the filling run in first one side and then the other, until the block is worked out. The levels below are worked in similar manner, the filling passing through the stationary loading chutes (at the levels) and across the track into the next winze beneath by use of an apron, which may be removed when desired until again required. This method demands a minimum amount of timbering and renders the mine safe as far as caves are concerned. It may be elaborated and extended from level to level and make available a large amount of ore at a low cost of mining.

* Bulletin No. 18, California State Mining Bureau.

TABLE OF MINE COSTS FOR TWELVE MONTHS ENDING SEPT. 30, 1900.

Mining and Metallurgical Patents.

Patents Issued January 8, 1901.

AMALGAMATOR.—No. 665,418; G. W. Fisher, Louisville, Ky.

An amalgamator, consisting essentially of supporting frame, bowl with concave bottom, agitating wheel running close thereto, wheel having hollow arms joined at center, presenting sharp front edges in direction of movement open at rear sides or edges, vertical tube supported by frame, rigid with arms and communicating with hollow portions thereof, means for rotating tube and arms, all combined.

DUMPING CAR.—No. 665,431; J. L. Ham, Huddleston, Va.

In a dumping car, body portion with hopper bottom, angle tracks supported by car, projecting below bottom thereof, trucks having wheels running on tracks, doors secured to trucks designed to close over outlet to hopper bottom, means for raising doors.

HOISTING AND DUMPING APPARATUS.—No. 665,574; C. A. Morris, Glen Ridge, N. J.

Combination with supporting frame, chute, dumping guide hinged in frame, means for supporting frame yieldingly in normal position, of counter shaft, drums thereon for hoisting and bucket ropes, bearing sheaves for bucket ropes rotatable concentrically with hinging axis of guide and bucket.

ART OF OBTAINING CHLORATES BY ELECTROLYSIS.—No. 665,426; W. T. Gibbs, Buckingham, Canada.

Process of obtaining chlorates from chloride of alkaline or alkaline-earth metals which consists in subjecting chloride in solution while flowing continuously through each of series of cells to action of elec-

tric current passing through cells in series, between two electrodes in each cell insulated from each other, but otherwise separated only by liquid, density of current used being such as to maintain solution in all cells at temperature high enough for decomposition of hypochlorites, and controlling temperature of solution in each separate cell by regulating flow of solution.

AUTOMATIC TAILINGS SAMPLER.—No. 665,620; W. Stephens, Redding, Cal., and J. P. Munger, Jamestown, Cal.

This invention is designed to collect samples of tailings or other material flowing through a sluice, and to deliver them into a receptacle where they may be tested to see whether the tailings are carrying off any unusual amount of valuable matter, or for other purposes. It consists of a wheel having paddles dipping into the current of flowing material, collectors carried by the wheel intermediate of the paddles, adapted to receive a portion of the passing material and separate it from the main body, said collectors being hollow, having slots or openings to their interior, and having at their outer ends plates projecting toward the approaching current so as to direct portions of the pulp into the slots or openings. A diagonally inclined plate extends from one edge to the other interior to the float and forms a discharge chute when the float reaches the upper part of its travel, and a receiving chute and collecting vessel are so disposed that the material is periodically delivered into it.

EXCAVATOR.—No. 665,685; O. Hetlesæter, Chicago, Ill.

Combination of crane adjustable in direction of length; link-work bucket arm pivotally supported upon crane, one member constituting an oscillating lever, pivotally attached to crane, support for bucket arm, lever longitudinally adjustable upon support; second member extending in general direction of oscillating lever; thrust segment connecting upper extremity of oscillating lever with second member; connections between lower extremities of lever and second member; bucket attached to second member at lower extremity.

GOLD SAVING APPARATUS.—No. 665,773; F. J. Drake, San Francisco, Cal.

This invention relates to an apparatus which is designed to save gold and like heavy valuable material and separate it from the lighter gangue with which it is found associated. It consists of a longitudinally inclined shaking frame having transversely channelled sections supported upon the frame and vertically adjustable plates, the lower edges of which correspond in shape with the channels and dip therein. A receiving box is mounted upon the frame and movable therewith, and has a supply pipe with a flexible section. A convex arched distributor is located within the box, upon the apex of which the

material is received and caused to flow in divergent lines outwardly toward the sides of the box. The latter has a slot or channel through which material is delivered upon the upper unchanneled end of the uppermost section. The inclined frame has upon it a series of independently removable transverse sections supported thereon, these sections having the bottoms inclined coincident with the inclination. The upper surfaces are depressed, extending horizontally from side to side, having upward concaved curvatures, with correspondingly shaped channels of substantially uniform depth extending transversely across the upper surface. The tops of the intermediate ribs are horizontal in the direction of the length of the apparatus, and each succeeding one is slightly lower than the next preceding vertical side wall of the channel. Plates are secured to the sections dipping into the channels so that the material flowing through must pass beneath the jaws of these plates.

PROCESS OF TREATING SULPHIDE ORES.—No. 665,744; H. F. Kirkpatrick-Picard, London, England.

Treating sulphide ores containing silver, zinc and lead; roasting ore to form of oxides, mixing roasted product with carbonaceous material suitable for coking, forming mixture into briquettes, distilling briquettes that they are first coked into coherent masses, finally zinc reduced and volatilized while lead is reduced; lead and silver retained in minute particles throughout coke.

DERRICK AND DUMPING DEVICE.—No. 665,757; W. S. Rynearson, Boise, Idaho.

Combination with scoop, hoist rope, casing, and bail connected with forward portion of scoop and upper portion of casing, of bar held to slide in casing, upper end connected with hoist rope, keeper formed therein, spring controlled latch carried by casing, adapted to enter keeper in bar, lever connected with latch, spring controlled keeper bar having sliding movement in casing arranged for locking engagement with lever, flexible connection between lower end of keeper bar and rear end of scoop, means for limiting upward and downward movement of casing.

LEVEL INDICATOR FOR HOISTS.—No. 665,821; C. E. Anderson, Aspen, Colo.

A level, station or landing indicator, for hoisting apparatus of mines and the like, comprising essentially pointer, revoluble disk marked to indicate levels, stations or landings in shaft, and having surface travel approximately showing position or travel of lifting vehicle in shaft, second disk similarly marked and having greater surface travel than first mentioned disk, dead spindle upon which disks are mounted to turn, and different gearing interposed between disks for turning them.

ROCK DRILL SHARPENER.—No. 665,185; R. M. Crockett and H. J. Bundy, Moscow, Idaho.

A rock drill sharpener comprising elongated stock provided at one end with annular die-face and with central socket or bore opening through face, centering stem fitted at one end in socket or bore of stock

and held rigid therewith, stem extending beyond die-face, removable and replaceable.

CAGE CHAIR FOR MINES.—No. 665,823; M. H. Beck and J. R. Caynor, Victor, Colo.

Combination with cage, of chairs mounted thereon, slide, lever connected with slide and having limited movement independently thereof, means for connecting slide with chairs, guide loop receiving outer portion of lever, catch arranged to be engaged by latter, and spring located adjacent to catch adapted to retain lever in engagement with same, projecting from catch to form guide for directing lever into engagement.

The Leaching of Copper Ores.

Written for the MINING AND SCIENTIFIC PRESS by DR. J. ORLY.

During the last three years the lixiviation of copper ores has grown into an industry of quite remarkable proportions in consequence of the steady demand for the metal and the high price maintained for it since that time. The impetus to the unfolding of this rather modern branch of metallurgy must be attributed largely to the conditions existing at the Butte copper mines, where the shafts of some abandoned diggings had been flooded by the influx of subterranean waters, which changed the chalcopryrite present, under the influence of the oxygen of the air, into sulphate of copper and iron, and thus prepared, without outlay or expense, solutions of metallic salts, which were soon recognized as a fertile source for the recovery of the copper values contained in them. Ideal conditions like these are, however, not encountered again in the territory of the United States, so that the first step in the production of copper by the leaching process must necessarily consist in the artificial preparations of the metallic solutions required for the subsequent separation of the copper. This reduction from solutions can be effected in several ways, the most usual being the addition of iron scraps, and the treatment of the liquids containing the metals by the electrolytic method.

A great number of acids and salts, when in aqueous solution, are known to exert a solving action of different gradation upon certain kinds of copper ore, and, consequently, a good many leaching processes have been patented in the past three years, among them a process of recent times, which resolves itself, on closer inspection, into the simple treatment of the crushed ore by means of sulphuric acid, salt and black oxide of manganese, and whose merits must appear rather doubtful to the average metallurgist on account of the expense incurred. Lately, also, the application of salt and nitre cake, or the employment of a mixture of both these compounds in aqueous solution, has been patented—a process which has been explained and described in the MINING AND SCIENTIFIC PRESS of Dec. 29, 1900.

In general, however, it may be said that the extraction of copper from its ores is best accomplished by the utilization of sulphuric acid alone, or of a mixture of the latter and nitric acid in dilute condition, which can be acquired in the form of so-called chamber acid from sulphuric acid works, and represents a very inexpensive and effective article for the purpose under consideration. Hydrochloric (muriatic) acid, which may be obtained at very low figures in the extreme East or West, where the manufacture of soda is yet carried on according to the Leblanc process, is also a good solvent for lixiviating purposes, though its use is naturally limited by local conditions. The writer has also found that a mixture of a solution of bichromate of potassium, salt and sulphuric acid constitutes a liquid which not only dissolves the copper from ores to a quite satisfactory percentage, but also removes the gold values from them, though the subsequent electrolytic treatment

for the recovery of the copper values offers some difficulties, which, however, may be readily overcome by the employment of a low electromotive force.

A large copper extraction plant, lately erected in the vicinity of Denver, Colorado, employs exclusively the chamber acid mentioned above, and the writer knows by personal experience that this liquid has given great satisfaction in comparison to the many solvents tried before. The ore in the case under consideration consists in the aggregate of carbonates of copper, accompanied by small amounts of copper sulphide, and it is quite evident that the contact of the crushed ore with an active dissolving and oxidizing medium, like chamber acid, which contains besides sulphuric acid varying amounts of nitric acid and the lower oxides of nitrogen, must greatly contribute to the rapid solution of the copper values present. No preliminary roasting of the ore being required in this case, it will be readily seen that the erection of an extraction works of this kind requires but limited capital, and that the resulting profits must be large; considering the high price of the final product.

On the other hand, an ore consisting mainly of copper sulphide, like chalcopryrite, or a siliceous copper ore, and a real silicate of copper requires careful and thorough roasting before lixiviation can be resorted to. Copper ores of this character are, as a rule, contaminated or mixed with iron sulphides (pyrites), and would require great amounts of nitric acid to change the sulphur present, which reaches sometimes 35% of the ore, into sulphuric acid, hence the cheaper method of subjecting the ore to a roast, effected at about 50 cents a ton, is employed in this case without exception. This operation is best performed in a reverberatory furnace, and is the only manipulation required, since the desired sulphate of copper can be obtained by this method in a condition suitable for the extraction by water alone.

The roasting of chalcopryrite, which we will consider first, can be conducted in such manner as to produce copper sulphate and ferric oxide as the final results exclusively. These results are obtained by carrying on the roasting process at a gradually increasing temperature, and by maintaining an oxidizing atmosphere throughout the operation,—in other words, by admitting air from the beginning to the end of the process. The changes occurring under observation of these conditions consist primarily in the formation of iron sulphate from the pyrites present, and in the subsequent decomposition of the latter into ferric oxide, which reaction is accompanied by the liberation of sulphur dioxide SO_2 and sulphur trioxide SO_3 . Simultaneously with these changes, the copper sulphide undergoes a gradual transformation into copper sulphate, which salt decomposes, however, at a higher temperature than the iron sulphate formed, and is brought back to the state of sulphate by the anhydrous sulphuric acid fumes produced from the pyrites, in case the heat of the furnace was too high, and sufficient to cause a part of the copper sulphate to be changed into copper oxide. On conducting and regulating the roasting process with the necessary care, the final product of oxidation will, therefore, consist of copper sulphate exclusively, which can be subjected to lixiviation with water, and the resulting solution either treated with iron scraps or by the electrolytic method to obtain the metallic copper. Hence, no acid is required in this case, providing the roasting process is well understood and executed with the necessary care.

In the second case under consideration—that is, on treating siliceous copper ore or real copper silicates for their copper contents by the leaching process—a preliminary roasting cannot be circumvented, either. We wish to add, however, as a reply to many inquiries made to us from time to time, that roasting alone will not answer for a successful treatment in this case—a point which is of the greatest importance, since enormous deposits of copper silicates are known to exist and lie idle, in default of a proper process, in California, Nevada and Idaho. To break up these intimately combined compounds, an admixture of common salt to the “moistened” ore, previously pulverized to 40 mesh, will be found to facilitate the decomposition of these bodies greatly, and to assure successful lixiviation subsequently. The reaction ensuing on subjecting this class of ores to roasting may be represented by the simple formula:

meaning that the silica of these copper ores is enabled, by applying the necessary heat, to combine with the sodium of the salt and thus to induce the liberated chlorine to unite with the copper present to form cuprous chloride. The reaction is, however, much more complicated than might appear from the formula, since the moisture, added purposely to the subdivided ore, contributes to the formation of hydrochloric acid and chlorine—two factors which are most essential for the formation of the cupric and cuprous chlorides actually resulting. Since the first of these compounds is soluble in water, and the second in brine, there arises no special difficulty in the extraction of these salts from the cooled crusty material drawn from the furnace, so that the copper values, now present in the resulting liquid, may be recovered by the addition of iron or lime, by the electrolytic method, or by means of a copper cylinder filled with iron scraps and made to rotate by appropriate machinery.

Since the acquisition of common salt is not combined with difficulties in any part of the States, this material will probably be preferred in most cases for the purpose intended. We wish to call attention to the fact, however, that it may be replaced by salt cake or sodium sulphate, which can be procured in some localities at a very low figure. The reaction occurring on subjecting a properly subdivided and moistened copper silicate to roasting with this material may also be represented by a simple formula, thus:

showing that the silica combines under these conditions with the sodium to form sodium silicate (water glass), while the copper combines with the sulphuric acid to form copper sulphate. But in this, as well as in the former, case the reaction occurring is really of a more complicated nature, owing to the presence of moisture and the formation of sulphurous fumes arising during the roasting. The final product consists, however, of copper sulphate, which may be leached out with water, and the solution obtained treated in a suitable manner. As to the amounts of salt to be added to the ore in the first case, and salt cake in the second, we wish to remark that an intimate incorporation of 15% of salt or 20% of salt cake to a 4% copper ore has been found by experiment to produce most beneficial effects, it being understood throughout this article that the application of the process indicated is limited to the treatment of low-grade copper ores exclusively.

In case the deposit to be worked consists mainly of sulphides of copper and is found by approximate examination to guarantee a mining of the ore for a number of years, the erection of a chamber acid works in combination with the lixiviating plant should find appropriate consideration—especially when the deposit is situated at a great distance from railroad communications, and the transportation of the acid is consequently combined with unusual difficulty and expense. A works of this character, which would allow of the employment of the solvent at the least possible figure, and should be limited to the production of chamber acid alone from the sulphides to be leached subsequently, would throw off an unusually large profit, considering that the present price of copper is maintained at 17 cents per pound, that the demand surpasses the supply by far, and that the output of the several American mines has not been sufficient to change this condition in the least during the last two years. It is also evident that in consequence of the expansion policy of the Government and the great number of electric enterprises now undertaken in Europe, this figure will be maintained for many years to come, and that no slump in copper prices is to be expected in the near future. These facts will become more clear when considering that the United States supplied already, in 1898, 55% of the metal used in the world, and that the great copper districts of the country produced the following amounts in that year:

	Pounds.
Arizona.....	110,823,864
California.....	21,543,229
Colorado.....	10,870,869
Michigan.....	156,669,098
Montana.....	216,979,337
Utah.....	5,385,246
Eastern and Southern States.....	4,478,218
All others.....	2,134,999
Copper sulphate (by-product).....	7,015,375
Total.....	535,900,232

This production has been raised during the year 1899 to the following figures:

	Pounds.
Arizona.....	125,377,758
California.....	23,915,486
Colorado.....	10,614,252
Michigan.....	155,845,786
Montana.....	237,953,951
Utah.....	9,310,344
Eastern and Southern States.....	3,804,617
All others.....	4,989,000
Copper sulphate (by-product).....	9,507,897
Total.....	581,319,091

And it may be predicted with certainty that the year 1900 will outstrip the annual production of 1898 and 1899 to a considerable extent.

(TO BE CONTINUED.)

Metallic and Non-Metallic Production.

The following is the total production of some metals and non-metals for 1899 and 1900:

	1900.	1899.
Coal, anthracite, tons.....	54,255,000	60,622,000
Coal, bituminous, tons.....	220,592,000	191,456,000
Iron ore, tons.....	26,417,000	25,341,000
Petroleum, barrels.....	63,100,000	57,234,000
Phosphate rock, tons.....	1,600,000	1,823,000
Aluminum, pounds.....	7,150,000	6,500,000
Copper, pounds.....	615,577,000	581,319,000
Gold, ounces.....	3,805,000	3,391,000
Iron, pig, tons.....	13,914,000	13,620,000
Lead, tons.....	252,000	217,000
Quicksilver, flasks.....	32,000	29,000
Silver, ounces.....	60,478,000	57,127,000
Zinc, tons.....	129,700	100,400

Annual Estimate of Metal Production, Coinage, etc.

Wells, Fargo & Co. send their annual report of precious metals produced in the States and Territories west of the Missouri river (including British Columbia and Yukon Territory) during 1900, which shows in the aggregate: Gold, \$99,100,733; silver, \$42,402,502; copper, \$69,752,284; lead, \$18,059,908; total gross result, \$229,315,427. The commercial value at which the several metals named herein have been estimated is: Silver, 61 cents per ounce; copper, 16 cents per pound; lead, \$4.37 per hundred weight.

STATES AND TERRITORIES.	Gold Dust and Bullion.	Silver Bullion.	Ores and Base Bullion by Freight.	Total.
California.....	\$14,421,835	\$302,948	\$3,766,171	\$18,390,754
Nevada.....	2,807,513	514,510	381,914	3,703,937
Oregon.....	2,899,614	131,420	5,000	2,436,034
Washington.....	336,949	165,353	173,848	676,150
Alaska.....	6,949,244	136,066	136,066	7,085,310

Device for Collecting Boiler Scales.

In the accompanying sketch I have depicted the interior of a horizontal boiler, showing flues, bottom, draft space and firebox, with an iron pan 4 feet long, 14 inches wide and 4 inches deep suspended by hooks from the flues and utilized as a scale collector. It was designed by C. C. Lewis, master mechanic at the Mary McKinney mine, at Anaconda, Cripple Creek district, Colorado. As set forth by Mr. Lewis, and as is generally recognized by boiler men, there is a central point at the

replaced with larger ones. At present the furnace capacity equals 1200 tons per day. The greatest piece of work has been the construction of over 3600 feet of horizontal flue line, making over 5000 feet in all, and the erection at the focal point of the various flue branches of a new smokestack, 18 feet diameter and 185 feet high. The flue structure is supported by heavy I-beams, holding together a metal frame; between the frame pieces are metal screen work, upon both sides of which is a heavy layer of cement. The dust chamber, at the lower part of the flue, is V-shaped, with an arrangement for gathering the

Device for Collecting Boiler Scales.

bottom of the draft space where the scale material is conveyed by the currents which form the circulation of the boiler, depositing there a heap of scales, resulting in "bagging" the boiler. The placing of the pan in the position indicated so changes the currents as to sweep the scales from the bottom at the "danger point" and deposit them by counter currents in the pan. One pan has been placed in each of the four boilers at the Mary McKinney mine, and a trial of five or six weeks has convinced Mr. Lewis and Supt. Keener of the success of the device, and they have applied for patent therefor. When the boilers are periodically cleaned, the bottom, where the "bagging" usually occurs, is found clean and the pans are found heaping full of the compact scale material.

ENGINEER.

Anaconda, Colo., Dec. 15, 1900.

Improvements at Arkansas Valley Smelting Plant, Leadville, Colo.

Through the courtesy of Manager Weddle, Supt. James and Asst. Supt. Johnson, the writer was enabled to make note of the improvements that recently have been made at the Arkansas Valley, or Leadville, plant of the American Smelting & Refining Co. Of the ten furnaces, seven have been enlarged and raised to a higher plane; four of these have each a capacity of 120 tons per day, the other three being good for 160 tons each per day. Three others, which are of the old type, have each a capacity of eighty tons per day. The latter are to be torn down and

dust and dumping it into cars, which pass along a trackage below and to one side. This plan of structure holds good for over 1000 feet, with the idea of collecting the dust daily. Through the remainder of the distance a simpler structure is found, the dust from that part being collected less frequently. This flue dust is gathered and mixed with lime and made into bricks by a briquette machine, in which shape it forms a part of the furnace charge.

A system of trackage, of same width as the narrow gauge railway, is being laid from the discharge floor of the furnaces to the slag dump for the purpose of hauling away the slag in cars by a locomotive.

To desulphurize the sulphide ores before sending them to the furnaces a system of roasters is used, consisting of twelve reverberatories, one Ropp and one Horseshoe, all having a capacity of 230 tons per day. A flue of nearly the same character as that described above connects the roasters with the main smokestack.

The siliceous, oxidized, roasted and carbonate ores are separately bedded in places accessible to the charge floor, there being from 6000 to 10,000 tons in each bed. The charge, made up of dust bricks, roasted ores, carbonates, oxidized and siliceous ores, lime and coke, is methodically handled.

With the exception of a small tonnage of lead ores from the Cœur d'Alene region, the ores handled by this smelter are produced by Leadville and Aspen mines. They have at this plant facilities for carrying a supply of about 25,000 tons of ore in stock.

WASCOTT.

Leadville, Colo., Dec. 27.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ARIZONA.

COCHISE COUNTY.

A company is being organized in Youngstown, Ohio, to work the Grand Central and Contention mines, near Tombstone, which have lain idle for several years.—Good reports are received from properties near Dragoon.—On the El Provencia at Cananea, near Bisbee, a tunnel is in 76 feet. One of the 350-ton furnaces is now running and two more will soon be in operation.

Manager J. S. Douglas reports good progress at the Esperanza (gold), near Bisbee.—The Moctezuma is shut down temporarily on account of a shortage of coke.—The Copper Crown Co., Dragoon, is shipping ore to the El Paso smelter.

GILA COUNTY.

The Pinal C. M. Co. will begin work on the Higdon & Haverly mines at Globe, recently bought by it. A hoist will go in on the Black Copper.—At the United Globe the miners are laid off owing to a shortage of coal caused by a strike of coal miners.

The furnace at the Old Dominion, at Globe, is daily treating 265 tons ore, and turning out 1,000,000 pounds of copper per month; it is said that \$150,000 per annum is being saved in fluxing alone; about 300 men are employed.—At the Continental (copper) high-grade ore, carrying gold and silver, is being stored.

MARICOPA COUNTY.

The Arizona Copper Mountain Co. of Minnesota, capital \$6,000,000, has begun operations in the Harqua Halas, near Phoenix. Diamond drills are in.

The Calmo Ore Co., capital \$500,000, is incorporated at Phoenix.

The Algonquin M. Co. is incorporated at Phoenix.

MOHAVE COUNTY.

Blakely & Harris have leased the Ben Butler, in Aubrey district, near Kingman, and they are now taking out ore which will be crushed at the Tremain mill, on the Big Sandy.—Minneapolis men have started work on the Ellen Jane and Tomanotto claims, in Music mountains, near Hackberry. The shaft on the Tomanotto will be sunk an additional 200 feet.—The sampling works at Kingman were burned down on the 9th inst. They will be rebuilt immediately.—Huntington & Averel, who have a bond on the Maguire mines, near Kingman, will put in an electric plant at the mines and will operate the mill and pumping machinery by electricity. They also figure on supplying Kingman with electric power and light.—The Elkhart Mining Corporation, Ltd., of London, England, will begin work on the Elkhart mines at Chloride soon.—Work on the Paymaster at Mohave is suspended owing to influx of water. A pump will be put in, the mine will be unwatered and work will resume.—J. Jackman is running a tunnel on the Old Overland, in the Wallapai mountains. The ledge is cut at the 75-foot mark.—The Tennessee concentrator is going in.—J. H. Johnson is sinking a new shaft on the Stockton.—R. Gray is taking out good ore from the Miner's Hope, Stockton Hill.—Kemper Bros. are working the Arizona Belle, on Stockton Hill.

PINAL COUNTY.

The Hailey & Souffrien lead mines, near Globe, are reported sold to Colorado men. Supplies are going in and work is to begin.

YAVAPAI COUNTY.

During 1900 the United Verde M. Co. of Jerome paid dividends amounting to \$2,325,000, or 77.5% on its capital stock.—Two ledges of aikenite, a mineral much used in the arts, and worth \$75 per pound, are reported opened up 7 miles south of Prescott.—The Brookshire at Jerome is closed down, owing to a break in the machinery.—Good ore is opened up at a depth of 30 feet on the Verde Con. group. The Sultana (copper), near Carbonera, in the Ures district, 40 miles east of Carbo, is sold to J. L. Giroux.

YUMA COUNTY.

The Arizona Giant Copper Co., operating the Trigo and Self Defense groups, near Ehrenberg, will probably put in a concentrating plant and a smelter this year.—J. W. Smith of Denver, Colo., has bonded the Sea Gull, Robert Lincoln, Lion and Tiger mines in Silver district, on the Colorado river, 40 miles above Yuma, for \$20,000. Work is in progress on the Sea Gull and Robert Lincoln. Should developments prove satisfactory, Mr. Smith will probably put up a 500-ton concentrating plant, either at the mines or on the banks of the Colorado, 5 miles distant.

The Arizona Giant Copper Co., operating 10 miles northwest of Ehrenberg,

will build a 100-ton per day concentrating plant on the Colorado river 6 miles from the mines; an electric power and light plant is also projected; twenty men are employed.

CALIFORNIA.

ALAMEDA COUNTY.

The mineral products of the county are salt, coal, manganese and structural material. The total value of the mineral output of the county for three years ending December, 1899, was \$1,255,888. Of this sum the value of the salt output was \$432,730 and of the coal output \$468,729.

AMADOR COUNTY.

The mineral products of the county are gold and silver, coal, copper, marble and pottery. The total value of the mineral products of this county for the three years ending December, 1899, was \$4,812,336. Of this sum the value of the gold output was \$4,675,704. In the spring of 1900 there were about thirty-seven gold mines, one copper mine, fifteen mills, three slimes plants, one chlorination plant and one copper smelter in active operation.

Drifting is in progress on the 300, 600 and 1200-foot levels of the Lincoln, at Sutter Creek; Supt. Voorheis.—The shaft on the Peerless is down over 600 feet; the payroll amounts to about \$2000 per month.—The Con. Jackson M. Co. of San Francisco, organized to work the Fleming, will sink a three-compartment shaft to the 1000-foot level.

The Motto, near Jackson, cleaned up \$1400 after one month's run recently.—The Emery M. Co. is working the Live Oak (quartz); a shaft is being sunk and drifting and crosscutting will be begun on the 200-foot level.—The Golden Eagle M. Co. is working the Reichel (gravel).—The Shepherd (gravel) is to be worked by the Emery M. Co.—The Ritter will be worked again this spring; a mill and other improvements will go in.—A tunnel will be run on the Martha, adjoining the Ritter.—At the Balliol mines, Sutter Creek, W. H. Storms Supt., the South Park Hill tunnel was in 230 feet on the 1st inst.; two crosscuts are being run—one at the face and one at the 190-foot mark; experimental tests as to relative cost of wood and coal for fuel show latter to be somewhat cheaper, wood now being held at \$8 per cord at the mine.—At the Mutual a new drift east of the shaft is started; fifty tons of good ore were recently taken from the west crosscut on the 400-foot level.—More men were recently put on at the Argonaut, sinking is in progress.—A good chute of ore is reported struck at the Mitchell.

After a shut-down of over a year the Cooper and Boom mines at Oleta have resumed operations.—Supt. Purrrington has everything running smoothly at the Grover and Fremont mines, Sutter Creek.—At the South Eureka the 20-stamp mill is running steadily; J. F. Parks Supt.

BUTTE COUNTY.

The mineral products of the county are gold and silver, mineral paint, mineral water and structural material. The total value of the mineral output of this county for the three years ending December, 1899, was \$1,714,030. Of this sum the value of the gold output was \$1,668,379. In May, 1900, six quartz, six drift and two hydraulic mines were being worked. Later on extensive dredging enterprises were put in operation.

The Cherokee, at Cherokee, has resumed operations; two monitors are working and three additional ones will be put in operation soon; the dam, 3 miles west of Pentz, is 1800 feet long.

CALAVERAS COUNTY.

The mineral products of the county are gold and silver, mineral paint and copper. The total value of these products for the three years ending December, 1899, was \$3,771,701. Of this sum the value of gold output was \$3,724,448. In April, 1900, there were twenty-five quartz, three drift, two hydraulic and two copper mines in operation, also thirteen mills, one copper smelter, two chlorination works, one cyanide plant, two electric power and six compressor plants.

On the Low Wallace group, 2 miles northeast of San Andreas, there are about 500 feet of tunnels.

At Sheep Ranch the electric line to the mill is about completed; as soon as machinery is in place operations will begin.

Another strike of rich ore is reported made at the Sunnyside, on Nelson creek, near Railroad Flat.—Work is progressing on the Little Giant (quartz), recently bonded to B. C. O'Neil of Jackson for \$3000. A shipment of ore recently made to the Selby Smelting & Lead Works, San Francisco, returned \$225 to the ton.—Work on the Last Chance and Afterthought mines, recently bonded to W. W. Cook of Mokelumne Hill, will begin.—W. V. Clark has started work on his gravel mine near Railroad Flat.—A new 4-foot Pelton wheel is going in at the Rose Hill mines, near Valley Springs.

COLUSA COUNTY.

In September, 1900, three quicksilver mines were in operation, and prospect wells were being drilled for oil.

The Gorrell well No. 2, at Arbuckle, is down 450 feet.

DEL NORTE COUNTY.

The mineral product of the county is gold, which, during the three years ending December, 1899, amounted to \$30,217. Recently there has been some attention paid to the copper mines of this county, and shipments of ore are reported.

FRESNO COUNTY.

The Ajax Oil Co., on Section 32, 19-15, Coalinga, is down 500 feet.—The well of the Corona Oil Co., on Section 32, near Coalinga, is down over 600 feet.—The Roanoke Oil Co. will sink a well near Coalinga.

HUMBOLDT COUNTY.

The mineral products of the county are gold and silver, mineral water and structural material. The total value of these products for the three years ending December, 1899, was \$883,113. Of this sum the value of the rubble rock, used principally in the harbor construction, was \$651,623. Copper prospects have been discovered, but there are no productive mines. During 1900 six companies have prospected for petroleum, and some oil has been struck.

INYO COUNTY.

The mineral products of the county are gold, silver, lead, copper, soda, borax and marble. The total value of the mineral products of Inyo county for the three years ending December, 1899, was \$1,247,696. Of this amount the value of the output of gold was \$411,134, and of the output of soda \$514,000. In July, 1900, there were thirty-two gold and silver mines and one borax, one salt and one soda works in operation.

KERN COUNTY.

The Superior No. 1, on Section 2, 11-24, Bakersfield, is spouting oil; although being pumped at the rate of 100 barrels per day, the oil can not be lowered an inch; drilling on No. 2 well will begin soon.—It is reported that a company is being formed to operate on lands in 26-28, where it is thought the sand will be struck at a depth of 2000 feet; new company will be known as the Travelers of Arizona.—The Queen Esther Oil Co. has started drilling on 31, 28-28; two additional rigs are going in.—The Con. Crude Oil Co. of San Francisco has leased twenty acres in the southwest quarter of 8, 29-28, on a royalty of one-fifth; purchase may be made at any time within six months at \$2500 an acre; a bonus of \$5000 was paid for the lease.—The Emerald Isle Oil Co. has put up a derrick on 18, 28-28, near Bakersfield.—The Golden Gate Oil Co., on 34, 12-24, has struck fine sand at a depth of 700 feet.

The hole of the Edgar, on 18, 28-28, near Bakersfield, is down 1360 feet.—The Western Minerals Oil Co., on 17, 11-23, has struck oil sand at a depth of 398 feet.—The Gould, northwest of Temblor, is down 1100 feet.—A. F. Morrison has leased the northeast of the southwest of 7, 29-28; he pays a bonus of \$1000, and agrees to drill to a depth of 2000 feet if oil is not sooner struck.—The Spencer Oil Co. is putting in a derrick on the southeast quarter of the southwest quarter of 28, 30-22.—The J. B. B. well, on Section 35, 12-24, is producing 2000 barrels per month.—The addition of Jewett & Blodgett's refinery, at Sunset, is completed; plant now has a capacity of 300 barrels oil per day.

LOS ANGELES COUNTY.

The Silver King Oil Co., capital \$500,000, is incorporated at Los Angeles.

The Glen Oil Co., capital \$1,000,000, is incorporated at Los Angeles.

NEVADA COUNTY.

A ledge of good ore is reported on the Kirkham, near Nevada City.—A good body of sulphurets is reported opened up on the 200-foot level of the Lecompton, in Willow valley, near Nevada City; the ledge is 20 inches wide, and ore is said to run about \$500 to the ton.—At Nevada City, Dunlap & Thomas are moving the machinery from the Wyoming to the Lecompton.

C. M. Root of Moore's Flat, operating the Independence (quartz), at Wolf creek, has unwatered the shaft, which is 181 feet deep, and is crosscutting on that level.

The Yuba, at Maybert, is reported bonded to J. L. Bryson and others.

ORANGE COUNTY.

The output of the Fullerton oil fields for December, 1900, was 51,000 barrels.—The Columbia Oil Co. is down 990 feet in its No. 9 well; No. 10 is down 950 feet.

PLACER COUNTY.

The Great Channel M. Co. of Chicago, which recently bought J. B. Sellier's gravel mine near Bath, is running a lower tunnel on the property, which will prob-

ably go to the 1300-foot mark.—A. Clark has put in a new pump at his tunnel at Yankee Jim's, and work is going ahead satisfactorily.—Handy & Ellison are working the Good Friday, at Ophir, with good results.

RIVERSIDE COUNTY.

It is said that an Eastern company stands ready to take over the iron mines in Eagle Mountain district when litigation between Cook and partners and Garrett and partners is settled; there are twenty-six claims located in the district, aggregating 538 acres.

SAN BENITO COUNTY.

The San Benito County Oil Co. at San Benito is down 560 feet.—At Hollister the Hollister Crude Oil Co. is putting in a rig on the Chappell ranch.

SAN DIEGO COUNTY.

Oil is reported at a depth of 600 feet at the Victoria, near Encinitas.—The well of the San Diego County Oil Co., near San Diego, is down 671 feet.—The Medina Oil Co., capital \$500,000, is incorporated at San Diego.—The well being bored on the Encinitas grant, near Encinitas, is down 700 feet; a rotary drill is used.

SHASTA COUNTY.

The Fremont Oil Co., capital \$300,000, is incorporated at Redding.—The Shasta Con. Oil Co. is putting up its drilling plant on Section 2, Township 32 North, Range 3 West, on Little Cow creek, near Redding. The Midas, in Harrison gulch, near Redding, is closed down temporarily, owing to a scarcity of wood.

SIERRA COUNTY.

The Telegraph, on Fur Cap, near Downville, is sold to J. W. Finney, representing Eastern men; the tunnel will be cleaned out, retimbered and driven an additional 150 feet.

SISKIYOU COUNTY.

At the Gold Ball, in Eddy Gulch district, near Yreka, fifty men are employed. The 20-stamp water-power mill is running steadily.—A recent mill run on 600 tons of ore from the Ohio gave \$10 per ton by amalgamation.—Work at the Portuguese is progressing steadily.—A vein of \$20 ore is reported opened up at the McBride; J. McBride, owner.—In Hungry Creek district twenty men are employed at the Gold Run; the output is given as twenty tons of high-grade ore daily.—Ore from the Hammar, same district, is said to run \$16 to the ton.—Work at the Cleaner, in Liberty district, goes ahead steadily.—At the Lanky Bob two tandem arrastras are crushing eight tons of ore daily; ore is said to run \$45 to the ton.—At the Hoodoo \$80 ore is being taken out.

A good clean-up is reported made at the former Oak & Co. claims, in Happy Camp; Manager Van Brunt.

TUOLUMNE COUNTY.

A 20-stamp mill is ordered for the Mack, at Groveland.—Drifting is in progress on the 400-foot level of the Rhode Island.—At Big Oak Flat the Mississippi is being dismantled; some of the machinery is on the Rhode Island.—A new mill and hoisting plant are to go in on the Mack.—At the Longfellow, drifting is in progress on the 500-foot level; the extra ten stamps will go in soon.—A good body of ore is reported opened up on the tenth level of the Dutch.—An engine and pump will probably go in at the Fleming.—Drifting both ways is in progress on the 800-foot level of the Grizzly at Carters, and drifting north is under way on the 700-foot level.—The new 10-stamp mill on the Hope is ready for work.

VENTURA COUNTY.

The Ojai Oil Co. has struck a good body of oil sand at a depth of 850 feet.—No. 1 of the Aguilla Oil Co. is down 110 feet.—The Gravity Oil Co., in Timber canyon, is down 780 feet in its No. 1 well.

COLORADO.

BOULDER COUNTY.

An incline is being run below the 600-foot level of the Yellow Pine, at Wall Street, recently leased to Older & McClure; ore is said to carry galena, gray copper, ruby silver and native silver running nearly \$1000 to the ton.—In the west drift in the Franklin, of the Wood Mountain M. Co., a 5-foot body of ore running \$14 to the ton is reported opened up.—Andregg & McRae have leased the Franklin shaft, and have put a winze on it.—The Gold Nugget Co., operating the Dime group, has ten men working and is shipping a carload of ore per week; a gasoline hoist and other machinery will probably go in soon; shaft is 65 feet deep, and tunnel is 600 feet long; new shaft and ore house are in.—The 60-stamp mill at the Slide, Boulder, is treating 200 tons of crude ore daily; fifty men are employed.—The Atlas Reduction Works, at Boulder, contemplates a bromination system for reducing ores, as now in use in Europe, and has sent its manager, C. D. Grove,

over there to examine into its merits.—The Logan, Wall Street, is said to have produced about \$100,000 during the year 1900.—The Nugget mill, at Ward, is running steadily.—At the Big Five a pipe line is being laid from the reservoir in the adit tunnel to the mill; when in, work will be resumed in mine and mill.—Sixty men are working at the Logan, Wall Street.—There are 1597 men employed in the mines of the county.—The shaft on the Lucky Star, at Boulder, is down 825 feet; levels are run both ways at 100, 150, 200, 250 and 300 feet; R. A. Duncan, manager.

Good ore is being taken out at the Bellevue, near Ward.—The tunnel on the Ward Rose is making good progress.—The Lucky Star, near Gold Hill, is shipping steadily.—The Golden Fox M. Co. is sinking a shaft and running a tunnel on the Golden Fox.—The tunnel in the Baltimore Bell is being timbered.—The Earl M. & M. Co. has started work on the Eclipse.—The B. & M. is shipping smelting ore; it is also storing mill stuff, which will be run through the mill now being put in shape.

CHAFFEE COUNTY.

The Tesmania Co., at Winfield, is pushing work on its properties; as soon as it has enough ore on the dump it will start up the smelter.—It is reported that the Buena Vista Smelting & Refining Co. will add two more stacks to its smelter at Buena Vista; a refinery will be built.

CLEAR CREEK COUNTY.

Work on the Kelly tunnel will be continued through the winter; the tunnel is to be driven 7000 feet.—The Oro Verde tunnel, at Yankee, is expected to cut the vein at a depth of over 400 feet.—The tunnel in the Mayflower is in 200 feet.—A station is being cut on the 75-foot level of the Cumberland; shaft will be sunk to the 500-foot level.—The '94 tunnel is going in; machine drills are used; the new mill cost \$30,000; capacity fifty tons per day; twenty men are employed.—The Sierra Nevada tunnel is in 400 feet.—The Stonewall has contracted with the '94 mill for daily treatment of twenty-five tons of ore.—Three shifts are running the crosstun on the Joe Reynolds, at Lawson.—Work on the Jack Rabbit is resumed.—A tramway is going in at the Red Oaks, near Georgetown.—The shaft on the Grand Truck, Gilson Gulch, is down 125 feet.—The tunnel in the Tropic, now in 600 feet, will be continued to the 3000-foot mark.—A new hoist is in on the Santa Fe.

Operations on the Doric tunnel, at Georgetown, will be resumed.—The hoisting plant at the Smuggler is in operation, and ore is being taken out of the level below the tunnel; sinking will be continued.—Georgetown is organizing a Board of Mines and Commerce.

DOLORES COUNTY.

The Emma mill, at Rico, is closed for the winter; work in the mine is progressing; ore is being stored for working next spring; Mgr. R. Keller states that the company contemplates building a large mill next spring.

EL PASO COUNTY.

The new Portland mill, going in near Colorado Springs, will have a capacity of 400 tons daily.

FREMONT COUNTY.

Daily oil yield at Florence is over 3000 barrels.

Daily capacities of mills at Florence are given as follows: The El Paso Reduction Co., 125 tons; Metallic Extraction Co., 400 tons; National G. Extraction Co., 125 tons; Dorcas M., M. & Dev. Co., 125 tons; Union Gold Extraction Co., 300 tons, and the Cripple Creek-Beam mill, 100 tons. The Dorcas mill, in construction, was so built that its capacity can be doubled when the company decides to enlarge the plant. Its capacity then will be 250 tons daily. The Page mill has a capacity of 100 tons also, but has been in litigation since its erection.

Nearly 1500 men are employed in the coal mines near Florence.

GILPIN COUNTY.

The shaft on the Justice, in Lake Russell district, near Central City, is down 700 feet; two shifts, thirty men each, are working.

GUNNISON COUNTY.

At White Pine the Lilly shaft is drained and will be retimbered.—Work in the Eckern tunnel is progressing.—The tunnel on the Lilly Dell, in Gold Brick district, is in 270 feet; the property is owned and operated by A. H. Conroy.

HINSDALE COUNTY.

J. H. Sloan is working the Travis group, on Gold hill, near Lake City.—New machinery is going in at the Peniston mill.—Hunt & Peavy are pushing development work on the Goshen.—The winze at the Black Crook will be sunk a distance of 100 feet.—At Carson, the Red Snapper, Miner's Fate, Yellow Jacket and

Boxer claims are deeded to the Bachelor M. Co. by J. F. Thompson as trustee.—The Ute working tunnel is now in over 1400 feet.—The Fleece mill has resumed.

HUERFANO COUNTY.

The Western Oil M. & Ref. Co., capital \$100,000, is working oil lands near Badito, in the Great Horn range, 10 miles north of Walsenburg; the company will build a refinery on the property should developments prove successful.—A new strike of coal is reported near Badito.—On the Mountain Monarch, at Ward, the Duplex M. Co. has a vein of galena ore 18 inches wide; assays run \$200 to the ton; eleven men are working, and more will be put on in the spring, when new machinery goes in.

LAKE COUNTY.

During 1900 the Home M. Co., at Leadville, produced 96,000 tons of ore, valued at \$700,000.—The output of the district for January is estimated at 2800 tons daily, valued at \$30,000.—The Home M. Co. has secured an extension of ten years to its lease of the Penrose, at Leadville.

A Pittsburg company has control of the Rex, at Leadville, and ordered new machinery.—Regular shipments of ore are being made from the Fortune, on Little Ellen hill.—On the Garbutt, thirty men are employed; from fifteen to twenty tons of ore are being shipped daily.—The Moyer shaft is shut down temporarily owing to a break in the hoister; a new hoist will be put in.

OURAY COUNTY.

The Meldrum tunnel, being driven from Ironton to Telluride, is in 800 feet from the Ironton end; the tunnel will be 12x12 feet, and when completed it will be 23,315 feet long and will run beneath the crest of the range 3426 feet, cutting the Sheridan, Japan, Revenue, Columbia, Menona, Tom Boy and other veins.

PUEBLO COUNTY.

The Elizabeth G. & S. M. Co. is incorporated at Pueblo to work properties in Poughkeepsie gulch.

SAN JUAN COUNTY.

The Silver Ledge at Silverton is to be developed on a large scale by J. B. Warner and others of Youngstown, Ohio; a mill with a capacity of 150 tons ore per day will be put in.

The crosstun on the Parker at Silver City is in 85 feet.—The smelter at Silver City has started up again.—The Senator tunnel, being driven into North Lookout mountain to tap the Harriet A. lode, is in 300 feet; estimated distance to run 35 feet.—Ore from the Victor Hugo in Maggie gulch runs \$60 to the ton.—The crosstun tunnel being driven on the Irene, now in 212 feet, will be run an additional 250 feet to tap the lead; Casad & Watson, owners; ores carry ruby silver and gray copper.—A new mill, with a daily capacity of 150 tons, is to go in on the Silver Ledge at Chattanooga next summer; J. B. Warner Supt.—On the Anglo-Saxon of the Gold King Con. M. Co. an upraise is being run from the tunnel to the surface.—The new engine for the Kendrick-Gelder smelter at Silver City is of 100 H. P.; tubular boiler is 16'x54'.

Near Silverton, a new air compressor will go in on the Tom Moore.—A mill will probably go in on the Occidental this spring.—The Red Mountain M. Co., A. A. Brown, Mgr., will begin operations on the Lead Carbonate group, on Las mountain, near Gladstone.

SAN MIGUEL COUNTY.

Output of the mines of the county for 1900 was as follows:

Gold.....	\$1,763,900
Silver.....	571,100
Lead.....	150,000
Copper.....	15,000
Total.....	\$2,500,000

Dividends declared and paid by mines of this county for the year 1900 were as follows:

Smuggler-Union (gold-silver)	\$400,000
Tomboy (gold).....	150,000
Japan (gold-silver).....	40,000
Liberty Bell (gold).....	60,000
Carribeau (silver-lead).....	20,000
Butterfly-Terrible (gold-silver)	30,000
Total.....	\$700,000

The Telluride end of the Meldrum tunnel is in 2000 feet.

During 1900 there were shipped from Telluride 1893 cars of ore.—The Smuggler-Union at Telluride has about 500 men employed; a 3000-foot tunnel, the Pennsylvania, is run in the property; New England Exploration Co., owners; production for 1900 is given as \$386,957.80.—Eighty 850-pound stamps are dropping at the Liberty Bell; plant is operated by water power during a part of the year, but principal motive power is furnished by two electric motors, current supplied by the Power Transmission Co.; mine and mill are connected by a tram 2 miles long;

eighty men are employed; output for 1900 is estimated at \$250,000.—During 1900 the Butterfly-Terrible produced nearly \$80,000; from thirty to forty men are employed steadily; \$400,000 worth of ore are estimated in sight.—The production of the Japan for 1900 is given as \$117,500, most of this being gold; a tunnel will be driven on the property.

TELLER COUNTY.

The property of the Merrimac Con. M. Co., consisting of 12½ acres adjoining the Mary Nevin at Cripple Creek, has passed into the hands of the Ross, Blake & Griffin Investment Co.; work will begin immediately.—The Zoe is shipping ore taken from the 300-foot level.—A deal is reported for the sale of the White Elephant, Happy Day and Fraction No. 1 claims on Gold hill, and fifty-three acres on Galena hill; if deal goes through a company will be organized to work the properties.—The Grace G. M. Co. will probably begin work on the Extra on Squaw mountain.

The machinery for the St. Thomas on Beacon hill, Cripple Creek, is on the ground.—The old 6x8 hoist formerly used on the Clyde is now on the Sedan on Galena hill.—The new machinery recently ordered for the Gold Bond on Gold hill is going in.—A new 125 H. P. boiler is in at the Independence Consolidated.—The new hoist for the Golden Cycle is going in.—The Cripple Creek Home M. Co. is crosscutting both ways from the shaft at the Home.—The Bush-Moffat tunnel, now being operated by the Gold Exploration Tunnel Co., is completed for a distance of 3000 feet.

A strike is reported in the tunnel of the Little Puck on Squaw mountain, Victor, at a point 700 feet in.—The Victor Leasing Co., operating on the north block of the Theresa, has opened up ore on the 150-foot level.

T. D. Faris is operating the Little Diamond on Battle mountain, Victor.—The shaft on the Eclipse is down over 400 feet.—Three new boilers, of 250 H. P. each, are to go in at the Elkton; foundations for and 46x68-foot building to cover same are going in; two stacks to go up over the boilers will be 100 feet high and 5 feet in diameter; two 25-drill air compressors will go in.—At the Ajax extensive additions are being made to the plant; an engine and dynamo are going in and a 25-drill air compressor will be put in.—A 100 H. P. boiler is going in at the Rubie of the Princess Alice Co.—The new hoist for the Legal Tender of the Golden Cycle Co. is expected to be running by Feb. 15th.—A new 250 H. P. boiler and a 15-drill air compressor are to go in on the Last Dollar.—A 25-drill air compressor will go in on the Vindicator.—At Cripple Creek the consolidation of the Beacon Hill-Ajax, the Morning Star and Mutual companies is made uniting twenty-five acres of ground in one group on Beacon Hill. The new company will sink a shaft on the Beacon Hill-Ajax to the 300-foot level, and will work the entire group through that shaft.—Sinking operations on the Kimberly at Victor are temporarily suspended, owing to a heavy flow of water struck at a depth of 370 feet.—Ore running from \$20 to \$40 to the ton is reported opened up on the fourth level of the Whisper shaft on the Gold Sovereign.—The Rubie of the Princess Alice Co. recently made a shipment of forty tons of four-ounce ore which was taken from the winze on the 900-foot level.—The shaft on the Lucky Guss is down 1000 feet.—The Jolly Jane Co. reports good progress in sinking the new shaft on the Tecumseh on Battle mountain. About 2 feet per day is made.—Development of the new strike recently made on the 335-foot level of the Mabel M. shows ore shoot to be 6 feet wide, and it is said that screenings bring \$360 to the ton.—At the Modoc work on the three-compartment shaft, which will go to the 1000-foot level, is suspended temporarily.

Phonolytic ore, running \$18 to the ton, is reported on the 300-foot level of block No. 1 of the Dexter, at Victor; Supt. F. Strohm.—The Creston M. Co. of Creston, Iowa, is running a tunnel, now in over 400 feet, in the Sunset, on Squaw mountain; J. R. Young manager.

IDAHO.

ADA COUNTY.

The War Eagle tunnel, near Boise, is in 3050 feet. It will go an additional 3000 feet, more or less; Supt. F. Irwin.

BLAINE COUNTY.

A new 20-stamp mill will go in on the Hattie at Hailey.

OWYHEE COUNTY.

The Trade Dollar Con. M. Co., Supt. J. Hutchinson, is running a working tunnel from Dewey to the Tip Top group.

SHOSHONE COUNTY.

The Gertie M. Co., capital \$100,000, is incorporated at Wallace to work a group of claims near Burke.—There are 2400

men employed in the Cœur d'Alenes, with a monthly payroll of about \$250,000.

The new 100-drill water power air compressor plant at the Morning, Mullan, is running successfully. Power is furnished by the largest tangential wheel in the country—33 feet in diameter—with two 12-foot Pelton wheels, one on each side of the large wheel. The present capacity of the reservoir is 100,000 cubic feet of free air at about ninety pounds pressure, or about 10,000 stored horse power. The distance of transmission is 4 miles.

MICHIGAN.

HOUGHTON COUNTY.

The output of the Wolverine, at Lake Linden, for the month of December, 1900, was 249 tons 800 pounds of mineral product; for last six months of 1900 it was 1422 tons 200 pounds, or about 2,485,000 pounds of refined copper, valued at \$180,000; new mill will go in soon.—The product of the Quincy for December, 1900, was 826 tons 1730 pounds of mineral.—The output of the Atlantic for December, 1900, was 267 tons 815 pounds of mineral; product for 1900 was 3288 tons 1995 pounds of mineral, or about 5,000,000 pounds of refined copper.—The Baltic during December, 1900, produced nearly 175 tons of copper.

MONTANA.

BEAVERHEAD COUNTY.

Ore assaying \$176 to the ton is reported in the Mascot, near Polaris.

MADISON COUNTY.

At Washington Bar the Tacoma M. Co. is driving its tunnel, now in 75 feet, to the 1000-foot mark, at which point it will begin crosscutting.—The Red Bluff, Red Chief and Water Lode mines, near Pony, are shipping ore regularly.—At Sand Creek a station is being cut on the 300-foot level of the Chile.

SILVER BOW COUNTY.

Ore running \$1200 to the ton is reported on 40-foot level of the Wasatka.

NEVADA.

ELKO COUNTY.

Ore running \$8000 to the ton is reported opened up on the Dexter-Tuscarora at Tuscarora.

Near Tecoma work on the Lewisohn property is going ahead satisfactorily. Ore from this mine will probably be treated at the old copper plant north of Tecoma.

The Dexter-Tuscarora at Tuscarora recently shipped gold bars and gold dust to the refinery at Argentine, Kansas.

ESMERALDA COUNTY.

It is reported that thirty-five miners are working at Tonapah, the new mining camp.

LINCOLN COUNTY.

Supt. F. P. Swindler has everything running smoothly at the De Lamar at De Lamar.—The shaft on the April Fool is down 310 feet (ninth level). Drifting both ways is in progress at this depth. A 22 H. P. gasoline engine is in No. 6 tunnel at the 2000-foot mark. The property is equipped with a 10-stamp mill, with a cyanide department. A 3-inch pipe line, 9½ miles long, brings water to the mine and mill.

LYON COUNTY.

J. Deitrich, operating a mine on East Walker river, near Dayton, projects a mill on the property.

STOREY COUNTY.

The 100 H. P. motor to run the air compressor at the Con. Cal. & Va. shaft, Virginia, is in. The feed cable for electric light and power is being put in the shaft.

WASHOE COUNTY.

The Jumper, Olinghouse, is shipping ore to the Proctor mill. The latter will start up as soon as the weather moderates.—The machinery for the Hutchinson mill is on the ground and construction work will begin soon. The main tunnel on No. 1 is going ahead satisfactorily.—High-grade ore is being taken out of the Crown Point.

The Wedekind at Reno is making steady shipments of ore, which is said to run \$2 to the pound.

WHITE PINE COUNTY.

The tunnel on the Sappho at Ely is being driven at a good rate of progress. Recent assays show ore to run \$40 gold, with a small amount of silver, to the ton. It is likely that a mill will be put in on the property during the year.

NEW MEXICO.

BERNALILLO COUNTY.

The Cochiti, near Bland, is employing 150 men; the mill is running steadily; new territory is being opened up.—At the Navaho the new tunnel is going ahead satisfactorily; forty men are employed.

LINCOLN COUNTY.

The American Placer Co., operating placers in the Jicarilla mountains, north of

Capitan, has completed a new dredger, which weighs 210 tons and will handle ninety yards of dirt per hour.

SANTA FE COUNTY.

The first furnace of the new smelter of the Santa Fe M. Co. at San Pedro is turning out matte; Supt. Nelson.

SIERRA COUNTY.

The Hillsboro G. M. & M. Co., owning a group of claims at Hillsboro, will put in rolls and a cyanide plant.

The Ashville (gold), 3 miles south of Grafton, will be worked soon.

TAOS COUNTY.

A new plant is going in at the Black Copper at Red River.—The tunnel of the Deep M. & M. Co. is going in steadily in Baldy mountain.—More men are at work at the Copper King, and ore is being sacked for shipment.—Near the Ragged Pants group, east of Red River, a shaft is being sunk on a body of tellurium recently opened up.—A strike is reported made in the Coodyke, near San Cristoval. Machinery will go in and systematic development be begun.

OREGON.

BAKER COUNTY.

The tunnel on the Independence, in Wind Creek district, near Sumpter, is in 85 feet. A crosscut shows the ledge to be 20 feet in width.—The boiler at the Badger is in place. Deep sinking will be started. The shaft is down 100 feet. Ore is being saved for shipment to San Francisco.—The Astoria & Melbourne M. Co., operating the Melbourne, near Sumpter, has crosscut the ledge at a point 100 feet in in the tunnel. The latter will be driven an additional 150 feet.—A 42-foot shaft is sunk on the Boer, in Bald Mountain district.—A 10-foot ledge is reported at a depth of 145 feet on the General Lawton, near Sumpter.—Work on the Keystone of the Fidelity M. Co. will be continued through the winter.

GRANT COUNTY.

A ledge of \$12 ore is reported opened up on the Oregon Boy, in Alamo district.—The tunnel on the Wonder, near Susanville, is in 60 feet.

JACKSON COUNTY.

The Old Channel Co. will operate three giants near Jacksonville.

MULTNOMAH COUNTY.

A smelter is projected at Portland. One hundred tons of ore daily have been guaranteed by mines operating along the line of the Oregon Railway & Navigation Co.

UNION COUNTY.

The Cornucopia mines of Oregon Co. has laid off fifty men at the Red Jacket, near Cornucopia.

SOUTH DAKOTA.

CUSTER COUNTY.

The Chicago Mica Co. is working the old Crown (mica), near Custer; twelve men are employed.—The Saginaw M. Co. of Saginaw, Mich., has begun work on a group of five claims 8 miles northwest of Custer; a 200-foot shaft will be sunk.—The New York (mica), 8 miles southwest of Custer, is said to be the largest mica producer in the United States; all ore mined is shipped to the Sils-Eddy Mica Co. of New York, they having agreed to take the entire output of the mine.

LAWRENCE COUNTY.

The National M. & S. Co., recently organized, will erect a smelter in Bear Butte district, near Galena; it will be in operation June 1st.—Hardin Bros. may put up smelting works on Redwater, 12 miles north of Deadwood.—E. May and others of Lead, owners of the Realization group in the Garden City district, 5 miles northwest of Deadwood, will probably build a cyanide plant there this spring; a shaft is sunk on the property, and a body of ore 150 feet wide is reported opened up.—At North Lead, the Golden Crown cyanide plant, recently enlarged to fifty tons daily capacity, is running.—The Pluma M. Co. will resume operations on mine and mill at Pluma this month.—The Imperial G. M. Co. has about completed arrangements for the erection of its 100-ton cyanide plant in Deadwood.

PENNINGTON COUNTY.

The Crown Hill M. Co. will soon resume operations on the Spokane, near Keystone; the 50-ton concentrating plant will be enlarged to 100 tons capacity and the shaft will be sunk to the 500-foot level; it is said that as soon as the concentrating plant is in operation, after enlargement, the company will erect a cyanide plant to treat ore from the Crown Hill, 1 mile east of Ragged Top.—The Gopher M. Co. is putting in a 50 H. P. gasoline engine at the Lena, 4 miles north of Hill City.

UTAH.

BEAVER COUNTY.

Ore from the Canadian of the Canadian

M. Co., at Milford, assays 4% copper and \$1.20 gold to the ton.

The Horn Silver, at Frisco, is shipping steadily.

BOX ELDER COUNTY.

Average value per ton returned from ore at the Century, Park Valley, is about \$7.50.

Two new mills will probably be built at Park Valley during this year.

CARBON COUNTY.

Anthracite coal is reported found 8 miles north of Price.

GRAND COUNTY.

The La Sal at Paradox is shipping ore.—The mill at Miner's Basin is shut down temporarily.

JUAB COUNTY.

Ore is being taken from the 200-foot level of the Star Con., at Tintic; the 600-foot level is being extended to tap the chute; Manager Packard.—A whim is going in on the Tiernan, North Tintic.—Good ore is opened up in the East Buckeye, at Tintic.

S. Bamberger of the Lower Mammoth, at Tintic, says that ore recently opened up on the 800-foot level of that mine will run 15% copper.—A station is being cut on the 600-foot level of the El Rey; Supt. T. L. Walden.—The Enterprise, Enterprise No. 2 and the I X L No. 1, at Tintic, will be operated by the Viru M. Co., recently incorporated at Provo City.

Copper ore is reported opened up on the 800-foot level of the Lower Mammoth, at Tintic.

Sinking will be resumed on the Lower Mammoth, at Tintic, and shaft will go to the 900-foot level.

Supt. Reid is taking out ore from the new strike recently made in the Galena, at Fish Springs; ore is said to run 30% lead and ninety-five ounces silver to the ton.

Work on the D. & B. group at North Tintic is going ahead.—The shaft on the Tesora at Diamond is down over 400 feet.—The shaft on the Ridge & Valley, Tintic, will go to the 725-foot level.—At the Little Chief drifting both ways is in progress on the 600-foot level.

The mill of the Eureka Hill M. Co., at Eureka, is closed down; operations underground, however, are under way.—The Galena M. Co. of Fish Springs has levied an assessment of 5 cents per share—\$5000—to be applied toward an indebtedness of \$8000; Manager Joseph will soon ship some ore from the property.—The Gemini, at Eureka, has resumed shipping ore.

The Shoebridge-Bonanza, at Tintic, Supt. Caruthers, is shipping ore regularly. The ore runs from 5.2% to 34.8% copper, 11 to 77 ounces silver and from 22% to 30% iron.

SALT LAKE COUNTY.

Operations on the Bazouk, at Bingham, are resumed; a new shaft is going down.

The Red Wing Co. of Bingham recently shipped twenty-two tons of ore from the Wolfe lease which ran 10% copper, twenty-five ounces silver and \$1.60 gold to the ton.

The Dewey mill, at Bingham, is running on silver-lead ore carrying gold and copper from the Northern Light, at that point.

The new rolling stock for tunnel No. 7 of the Highland Boy, at Bingham, is going in. When finished, all ore is to be taken through this tunnel. During 1901 the smelter will treat 450 tons daily.—Assays on ores from the Ben Butler, at Bingham, show them to run 30% lead, 6 ounces silver and \$1 gold to the ton. Supt. McQueen is driving an upraise.—Work on the Copperhead, in Detroit district, will be resumed soon, it is thought.—A mill will probably go in on the Charm, same district; G. Ormsby, Supt.

SUMMIT COUNTY.

During last week the Marsac mill, at Park City, handled over 200 tons of ore from the Daly-West, near there; ore came from the 1200-foot level.—The rumor that the Daly-West and Ontario will consolidate is denied.—A strike of good ore was made recently on the New Sensation, in Big Cottonwood; ore carries gold, silver and lead, and was opened up at the bottom of the winze at a depth of 140 feet.—Three shifts are working in the Alliance tunnel drifting towards Union ground in a northerly direction; they are in about a mile.

A find of a good body of ore is reported from the Valeo, at Park City.

TOOELE COUNTY.

At Grantsville the old tunnel of the Bell M. Co. is being extended; a new tunnel may be run to tap the vein at a depth of 450 feet.

The Sunshine mine and mill, at Sunshine, Camp Floyd district, are reported sold for \$312,500; contract calls for completion and operation of a mill of 300 tons daily crushing capacity, with a leaching capacity of 750 tons, within 6 months from date of sale; mill is to run continu-

ously on 200 tons of ore daily; G. C. Moore will be manager.—The new electric motor at the Con. Mercur, at Mercur, is now hauling ore over the tracks of the tunnel and tramway to the mill.

The new furnace at the Sacramento, at Mercur, is nearly completed.

The Viru M. Co., capital \$25,000, is incorporated at Provo City.

The Brickyard, at Mercur, will resume operations; twenty men will be put on.

UINTAH COUNTY.

The Hyde-Cunningham Co., operating asphaltum properties south of Ashley valley, near Vernal, has put on more men.

In the Jesse McEwing mining district it is said that an Eastern company will take hold of the O'Neil-McCune copper properties and develop them.—C. O. Baxter has bought twenty-one asphaltum claims in the White River district for \$9100.

WASHINGTON.

FERRY COUNTY.

Supt. M. Hodges of the Princess Maud, Republic, has made his annual report to the shareholders of the company, showing a satisfactory state of affairs at the mine.

The California M. Co. at Republic will put in a new steam hoist on the California.—The crosscut tunnel on the Bodie, on Toroda creek, a few miles north of Republic, has cut a 12-foot ledge of good ore at the 430-foot mark.

OKANOGAN COUNTY.

The Review, Meyers Creek district, near Chesaw, is making preparations to ship steadily to the smelter.—The Yakima will also begin shipping.—The Interstate M., M. & D. Co. of Columbus, Ohio, will begin work on the Delate, adjoining the Review.—The Monterey G. M. Co. has run its tunnel into Buckhorn mountain 400 feet.—Work on the War Eagle will resume soon.—The Poland China is reported sold. Work will begin shortly.

The tunnel on the Lakeview, on Mt. Ellmeham, now in 200 feet, will be driven an additional 125 feet.

STEVENS COUNTY.

The shaft on the Anderson, 9 miles from Valley, is down 100 feet; ore from this depth carries copper and gold; King G. & C. M. Co., owners; Manager McAviney.

WHITMAN COUNTY.

The new hoist for the Blue Bird, in the Hoodoo district, 35 miles east of Palouse, and operated by the Chickasaw M. & S. Co., M. W. Truax Supt., is going in. Two shifts will be put on. Shipments begin next May.

WYOMING.

BATTLE LAKE COUNTY.

Ore running 30% copper is opened up in the 115 and 190-foot levels of the Battle Lake Rambler, near Battle Lake.

FOREIGN.

AUSTRALASIA.

During 1900 the gold production amounted to \$75,283,215.

BRITISH COLUMBIA.

The output of the Sullivan for December was 1370 tons. A new tunnel will be run.—Three tunnels are run on the Bill Nye, on Trail creek.—A 100-foot tunnel will be driven on the Stanley.—On the St. Lawrence a 100-foot tunnel is completed. During 1900 the mines of Southeast Kootenay shipped 35,753 tons of galena ore, having a valuation of \$1,923,580.—In 1900 the North Star shipped 15,513 tons of galena ore, having an average value of about \$50 per ton, a total of \$775,650.—The St. Eugene Con. mines have shipped 13,593 tons of concentrates during 1900, which, at the ratio of 3 to 1, means an output of 40,779 tons of crude ore, valued at \$815,580.—The output of the Society Girl for the year 1900 is given as \$50,000.—The main tunnel on the Blue Grouse, on Sand creek, near Cranston, is in over 200 feet.—Work will continue through the winter on the Waterfall.—Another company is seeking incorporation at Greenwood to run a tunnel from Greenwood to Phoenix, or from Grand Forks to Phoenix. If the project goes through the tunnel will pass under the center of Phoenix camp at a depth of 2025 feet.—The Wagner group, in the Lardeau, is reported bonded to F. Watson, representing New York men, for \$100,000.—Nineteen tons of ore from the Bondholder group, on Springer creek, near Slocan, recently shipped to the Hall Mines smelter at Nelson, returned 224 ounces silver and 7% lead to the ton.—The War Eagle shaft, Rossland, now down 1200 feet, is the deepest in the Kootenay country. No. 1 shaft, now down 600 feet, will be sunk an additional 100 feet.—The five-compartment shaft at the Le Roi, now down 900 feet, will be sunk to the 1000-foot level.—Drifting is in progress on the 400-foot level of the

Evening Star.—The management of the First Thought, near Nelson, contemplate putting in a cyanide plant this spring. Twenty men are blocking out ore, etc. A depth of 175 feet has been attained.—On the Easter Sunday the diamond drill has reached a depth of 100 feet.—The shaft on the Montana of the Union G. M. Co., Manager Cooper, is down 90 feet. Sinking will be continued.

INDIA.

Output of gold for the year 1900 is given as 457,020 ounces; yield for 1899 was 410,678 ounces; output of oil for 1900 was 32,934,007 barrels, and for 1899 it was 18,973,978 barrels.

MEXICO.

The Creston-Colorada Co. own the old Minas Prietas mine and the Creston, adjoining it on the west, at Minas Prietas, where the principal machine and carpenter shops and roaster of the company were situated; also, the La Mina Colorado, less than a mile west of Minas Prietas, at La Colorado. The Wyman shaft is a new vertical shaft, which has been sunk on the Colorado vein east of the old incline shaft, for greater ease and economy in working. They have developed good ore bodies during the two years that development work has been going on. The company also own other claims; but these are the principal ones worked. When everything is ready, they will supply the mill with ore from the Wyman shaft while they look for other ore bodies in the Creston and Prietas mines.

La Colorado, Sonora, Mexico, Jan. 10.

The chairman of the Palmarejo & Mexican Gold Fields, Ltd., is giving the properties an examination with view of changing manner of working the ore. The old Palmarejo mine, last year reported worked out, is again yielding large quantities of 20-ounce ore (silver); the mill runs on full time.

The White Chief Co.'s mill at Agua Caliente is hammering away and the mine is reported in bonanza.

The Abundancia and Reliz de Tetamoa properties, idle since 1894, are being reopened by Gedney & Young, who report a 5-foot vein of high-grade ore, and will start the 10-stamp mill Feb. 1st.

The expert who came to examine the Piedras Verdes, near Alamos, Sonora, has the refusal of the property until Jan. 20 at \$1,500,000.

The Three H Co., at Guazaparas, is getting in shape to produce bullion. This is counted one of the best properties in this section.

C. Doane and W. Morgan are examining the Ramos mines with view of purchasing. Chinipas, Chihuahua, Jan. 3.

Commercial Paragraphs.

THE Modern Machinery & Electrical Co. of Denver, Colo., supersedes the Coal Machinery Co.

H. D. CRIPPEN, 52 Broadway, New York, has assumed control of the Jackson hand power rock drill as sole licensee and manufacturer, his Western office being at 1756 Lawrence street, Denver, Colo.

THE Chicago Pneumatic Tool Co. has purchased the plant and business of the Great Western Pneumatic Tool Co. in Denver, Colo., and will manufacture the Schmucker drill and air compressors at the Denver shops, of which C. H. Skinner is manager.

THE Robert Aitchison Perforated Metal Co., 303 Dearborn street, Chicago, report being busy on orders for perforated metals for use in fanning mills, ice machines, clay screens and cottonseed oil machinery, besides small orders for repair work, and say that 1901 is starting out with every evidence of continued prosperity in their line.

Recently Declared Mining Dividends.

	Payable.
Portland M. Co., Colorado, 6 cents per share, \$180,000	Jan. 5
Doctor-Jack Pot M. Co., Colorado, 1 cent per share, \$29,000	Jan. 5
Butterfly-Terrible M. Co., Colorado, 1 cent per share	Jan. 28
Center Star M. Co., British Columbia, 1 cent per share	Feb. 1
New Zealand G. M. Co., Colorado, 10 cents per share, \$60,000	Jan. 10
Vindicator G. M. Co., Colorado, 2 cents per share, \$27,500	Jan. 25
Gwin M. Co., California, seventeenth dividend, \$15,000, total to date \$166,500	Jan. 15

Catalogues Received.

The catalogue of the Ludlow-Saylor Wire Co., manufacturers of wire cloth, gives just the kind of illustrated information probable purchasers of that article would want, and can be had upon request, of the Ludlow-Saylor Wire Co., Fourth and Elm Sts., St. Louis, Mo.

Latest Market Reports.

SAN FRANCISCO, Jan. 17, 1901.

SILVER.—Per oz., Troy: London, 29½d (standard ounce, 925 fine); New York, bar silver, 63½c (1000 fine); San Francisco, 63½c; Mexican dollars, 50½c.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25 cash; carload lots, 17.00; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.62½; Casting, 1 to 3 casks, 16.75; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22½c.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.20; Missouri lead, \$4.32½ desilverized lead; San Francisco \$5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6½, sheet 7½, bar 6c; pig, \$4.70 @5.10. London, £16 7s per ton.

SPELTER.—New York, \$4.15; St. Louis, \$3.95; London, £19 per ton; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13½c; 100-lb lots, 15c@18c.

IRON.—Pittsburg, Bessemer pig, \$13.50; gray forge, \$13.75; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$19.75; open hearth billets, \$21.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.50; San Francisco, ton lots, 29c; 1000 lbs., 29½c; 500 lbs., 29½c; less, 30c; bar tin, \$30.00 @35c.

QUICKSILVER.—New York, \$52.50; London, £9 2s 6d; San Francisco, local, \$48.50 @50.00; Export, \$45.

NICKEL.—New York, 50¢@60¢ @ lb.

MAGNESIUM.—New York, \$3.00 @ lb.; San Francisco, \$4.00.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 15½c.

ASSAY LITHARGE.—San Francisco, 10c @ lb., small lots.

BUREAU CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 11th day of December, 1900 an assessment (No. 25) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of January, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of February, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

GEO. W. DIXON, Secretary.
Office—Room 31, 214 Pine street, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 28) has been postponed to TUESDAY, the 29th day of January, 1901, and the day of sale from the 5th day of February, 1901, to TUESDAY, the 12th day of February, 1901.

By order of the Board of Directors.
GEO. W. DIXON, Secretary.
Office—Room 31, No. 214 Pine street, San Francisco, California.

SITUATIONS WANTED.

Experienced licensed land and mine surveyor, competent at assaying and report work, bookkeeping and photography, wishes a position for three months or less. Partial outfit. References exchanged. H. W. H. Pennington, Santa Cruz, Cal.

POSITION AS MILL MAN OR VANNER MAN.
Capable of taking charge of mill. Can give good references.
Address J. H.,
40 Pond Street, San Francisco, Cal.

POSITION WANTED by a first-class all round mining man of wide experience and up to date in mining and concentrating, with business qualifications and an accurate assayer. First-class testimonials. Address "Mining," care Mining and Scientific Press.

WANTED—A position as superintendent for a mining company by a man of 16 years' practical mining experience; understands mining and milling (amalgamation, concentration and leaching); good assayer and accountant; would accept a subordinate position if good; references. Address "Advertiser," 1225 Webster St., Oakland, Cal.

Situation Wanted by Mining Engineer of 20 years' experience in California, Colorado, Mexico and Germany. Has had charge of large properties—gold, silver, lead, copper, sulphur and oil. College graduate; good assayer, surveyor and accountant; speaks Spanish. Has experience in railroad construction and road building. Formerly U. S. deputy mineral surveyor and member of geological field force. Will go anywhere. Address P. M., Mining and Scientific Press.

Experienced Metallurgist and Chemist of high standing, with first-class references, is open for immediate engagement as superintendent of a lead smelting or cyanide or chlorination plant, preferably located in California, Arizona or Montana. Would be willing to accept moderate salary with small interest in plant or lease same. Address M. J. E., 1022 South 14th Street, Denver, Colorado.

CHEMIST AND ASSAYER, with experience in draughting, bookkeeping and typewriting, desires position as assayer or assayer and bookkeeper in mine or as secretary to mining engineer or mine official. Has fair literary and scientific education. Experience in the preparation of reports, prospectuses and catalogues. Excellent moral character and good health. For further particulars, address E. K. M., care Mining and Scientific Press.

Mining Accountant and Store Manager.

A young man of energy and ability, and thoroughly experienced in all details of mine accounting, store managing, buying, contracting, etc., is desirous of obtaining an opening. Is fully qualified to assume full charge of such work or to render general assistance. Highest references will be furnished and satisfactory services guaranteed. Address B. P. O., this office.

WANTED.

WANTED.
A Second-Hand Automatic Cut-Off Engine.
40 H. P. OR 45 H. P. IN GOOD ORDER.
Address MINING CO., Box 10, care of this office.

WANTED.

Assayer, Chemist and Surveyor,
with Surveying Instruments.

Must furnish good references as to character and ability and from previous positions. Give age; experience. Single man preferred. Steady work. Wages \$75 per month and board.

Address A. C. S., Box 512, Prescott, Arizona.

Special Meeting of Stockholders.

Notice is hereby given that a special meeting of the stockholders of the RUBY GOLD GRAVEL MINING COMPANY will be held at the principal office of the company, Room 24, 330 Sansome St., in the city of San Francisco, CALIFORNIA, on the 28th day of January, 1901, at 2 o'clock P. M., for the purpose of electing a Board of Directors and the transaction of such other business as may come before the meeting. JOSEPH H. MOOSER, Secretary Ruby Gold Gravel Mining Company, 330 Sansome St., Room 24, San Francisco, Cal.

BRITISH COLUMBIA MINES.

Gold, Silver-Lead and Copper Properties. Excellent chance for profitable investments in legitimate mining in BRITISH COLUMBIA. Capital needed for developing promising prospects. A specialty made of FREE MILLING GOLD properties. Very promising FREE MILLING GOLD properties for sale; terms reasonable. Mines examined and reported on by reliable mining engineers. Correspondence solicited. Address Andrew F. Rosenberger, P. O. Box 700, Nelson, B. C.

SPECIAL NOTICE.

Capitalists and wealthy syndicates desiring to purchase large operating gold and copper mines, at present low prices, can most likely find what they want by corresponding directly with the undersigned. By so doing, buyer and seller can be brought together without the intervention of useless and undesirable promoters, brokers and mine dealers. E. J. FRAZER, 522-553 Parrott Building, San Francisco, Cal.

THE COLORADO IRON WORKS COMPANY,

ENGINEERS AND MANUFACTURERS OF

Smelting Furnaces and Equipments.

The illustration in this advertisement shows one form of our COPPER MATTING FURNACE, employing hot blast; the air being first treated in proper appliance, is conducted through the cast iron bustle pipes placed along the inside of the caisson plates, through the cast iron adjustable tuyeres. This furnace can also be used for silver as well as copper smelting, by changing lining in crucibles. We build them in any size required.

Cold blast may be used if preferred.

The furnace is equipped with our special cast iron jackets, and our patented system of water-jacketed mantles.

Send for our catalogue, showing many different styles of smelters for the treatment of

GOLD, SILVER, LEAD, COPPER AND NICKEL ORES,

also the latest and best method for the economical use of jacket water (a saving of 80% to 90% guaranteed) by our patented

WATER VAPORIZING ATTACHMENT.

We design, manufacture and erect Mills for Concentration and Amalgamation, Milling, Chlorination and Cyanide Processes. In writing for information, give us the analysis or character of the ore to be treated, to enable us to intelligently arrive at the proper method.

Our very complete catalogue of CRUSHING MACHINERY will be sent on application.

DOUBLE CYLINDER SINGLE DRUM HOISTS.

The above form of Hoisting Engine has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes which assures quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

may prove the solution. Apply to Wetherill Separating Company, 52 Broadway, N. Y.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

CROWN GOLD MILLING CO.

To MINERS and MILLMEN.

If your ores are refractory; if you are losing concentratable values in your tailings; if your mines are in an arid district, or so situated as to make the introduction of water ruinously expensive; if you have large bodies of concentratable ores which could not be profitably treated hitherto,

THEN READ WHAT FOLLOWS:

The CROWN GOLD MILLING COMPANY'S concentrating machinery will concentrate any ores, sands or earths carrying metallic particles or metallic combinations of concentratable dimensions.

A shipping product of unexcelled purity is given, the greatest amount of concentratable values extracted, and a greater tonnage of ore is put into a ton of concentrates than by any other system of mechanical treatment. Every pound of ore delivered to machines is accounted for in the ore and concentrate bins.

It will cost you nothing to investigate, and may mean an increased profit on your ores, or a profit on bodies of ores which heretofore have failed to pay more than cost of treatment; or you may be enabled to make a productive property of a mine now idle.

We have a twenty-ton capacity plant in operation. All are invited to call and test it: from 1000 to 2000 pounds ore will be treated as a test. Charge \$20, to cover cost assays. Results at mine guaranteed to equal results obtained in testing. Wear and tear and labor cost guaranteed not to exceed cost by wet treatment of same character of ores.

Our machines are not for sale: they are placed on lease or royalty charge as may be agreed upon, and if results are not obtained as guaranteed no one loses but ourselves. Practice is better than theory: direct evidence is better than hearsay. All we ask of you is to come and be convinced that we have claimed less than we accomplish.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

SALE.

Six ^{FIVE} FOOT ^{FOOT} Huntington Mills

TOGETHER WITH NECESSARY

CRUSHING AND POWER PLANT.

Will Be Sold as Separate Items or Entire Mill.

PRESENT LOCATION: NEAR DEADWOOD, SOUTH DAKOTA.

Used Less Than Three Months. Guaranteed in Splendid Condition.

WILL NAME PRICES F. O. B. DEADWOOD, CHICAGO, OR DELIVERED AS DESIRED.

SPECIFICATIONS (Condensed).

- 6 ORE GATES, 24 x 38, rack, hand wheel, frames, bolts, complete.
- 2 ORE BINS, all necessary bolts, rods, nuts and washers.
- 2 GRIZZLEYS, 4' x 10', 1" openings.
- 6 CHALLENGE AUTOMATIC ORE FEEDERS, including hoppers, wood frame, shafts and pulleys.
- 6 HUNTINGTON CENTRIFUGAL ROLLER MILLS, 5' diameter, all fixtures and fittings, complete with wooden frame, shafts, pulleys and gearing.
- 6 COPPER TABLES, 6' x 12', 1/8" copper, electroplated 1 oz. of silver per square foot.
- 2 AMALGAM SAFES.
- 1 BELT TIGHTENER, complete with pulley, boxes, etc., for main belt.
- 1 BELT TIGHTENER, complete with pulley, boxes, etc., for crusher.
- 1 CORLISS ENGINE, built by Fraser & Chalmers, cylinder 20" diameter by 48" stroke, complete in every particular, shaft 10" in diameter, band flywheel 16' diameter, 30" face; weight, 42,000 pounds.
- 3 HORIZONTAL TUBULAR BOILERS, 54" diameter, 16' long, complete with steam drums 30" x 72", mud drums 18" x 66" for each boiler, breechings, smoke box, stack 48" diameter 60' long, all necessary guy rope, half arch fronts, grate bars, cast and wrought iron parts necessary for setting, feed, blow off check and safety valves, gauges and all fittings. Weight, 51,000 lbs. At present these boilers are arranged for setting in one battery. We will make any changes required, furnishing stacks and other items necessary to set each boiler separately.
- 1 HEATER, tubular, 30" diameter, complete, with exhaust pipe.
- 2 NO. 5 KNOWLES BOILER FEED PUMPS.
- 1 BERRYMAN HEATER, 18" diameter by 7' long, copper tubes, 4" pipe inlet and outlet.
- 1 HOOKER VERTICAL SINKING PUMP, 14x8x14, 6" suction 5" discharge.
- 8 ORE CARS, one ton capacity each.
- 1 WATER WHEEL, 50 H. P.
- 1 16" BULLION FURNACE, complete, including 10" Gold Retort, stack and all iron work.
- 1 NO. 5 STYLE B GATES FINE CRUSHER.
- 1 LOT REPAIR PARTS FOR HUNTINGTON MILLS, including roller shells, ring dies, scraper bars, shoes, screens, clamping plates, all new, never used.
- 1 LARGE LOT OF PIPE AND FITTINGS.
- 1 LOT BOLTS, WASHERS, RIVETS AND NUTS.
- 1 LOT OF MISCELLANEOUS SHAFTING, PULLEYS, PILLOW BLOCKS, HANGERS, ETC.
- 120' RUBBER BELTING, 28", 6-ply.
- 58' RUBBER BELTING, 18", 4-ply.
- 150' RUBBER BELTING, 16", 4-ply.
- 70' RUBBER BELTING, 14", 4-ply.
- 2 LOCOMOTIVES, 20" gauge, built by H. K. Porter Co., Pittsburgh, one 6x10 cylinders, the other 8x14 cylinders, both saddle tank.

TREAT YOUR ORES,
SAVE YOUR VALUES,
CONCENTRATE
AND
AMALGAMATE

In substance at one operation
by the

Hooper
Pneumatic
System.

Floor Space, 3x6 Ft. Weight, 2250 Lbs.
Capacity, 10 to 50 Tons Daily.

WE USE NEITHER
WATER, CHEMICALS NOR QUICKSILVER.

Ores, etc., Treated:

Gold,	Copper,	Corundum,
Lead,	Chrome,	Antimony,
Zinc,	Nickel,	Cinnabar,
Mica,	Clays,	Black Sands,
Tin,	Garnet,	Any Sands,
Slags,	Graphite,	Mixed Ores,
Silver,	Fluor Spar,	Metallic Ores.

SAMPLE LOTS TREATED FREE.
WRITE FOR SHIPPING TAGS.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

Is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape

DRY PLACER MACHINES.

THE PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries. SEND FOR DESCRIPTIVE CIRCULAR.

THE MIDLAND TERMINAL RAILWAY COMPANY.

Sixty miles shorter than any other line operating between Denver and Colorado Springs and Cripple Creek.

Three Daily Trains Each Way Between These Points. Through Pullman Sleepers.

W. K. GILLETTE, President. L. R. FORD, Gen'l Freight & Pass. Agt.

The walls of a house are built for protection. If the sun and weather open up the sheathing, the rain or the air will get in and cause discomfort and doctor's bills. To prevent this the architect or builder uses building paper. There are many kinds, but only two classes—the poor and the good. P & B PAPER is good—the best. It is very strong, odorless, waterproof and airproof, and will not rot. Ask your dealer for samples, or write us for them. We are the makers.

SMOOTH-ON COMPOUND AN IRON CEMENT

For repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts the same as iron, insuring a tight joint at all temperatures. Difficult flanged connections can easily be made with SMOOTH-ON COMPOUND, as it adapts itself to the flanged faces, whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching.

The above illustration shows an operator taking an incline above the horizontal with BRUNTON'S PATENT POCKET MINE TRANSIT. The instrument is made especially for mining engineers, mine managers and superintendents, but its light weight and the ease with which it can be handled render it admirably adapted to the taking of topography and for geological field work. Write for catalogue B, giving full description of the instrument and all its uses, to F. W. Braun & Co., Los Angeles, Cal., Agents for balances and the Brunton Patent Pocket Transit. John Taylor & Co., San Francisco, Cal., Agents for balances and the Brunton Patent Pocket Transit. H. S. Crocker Co., San Francisco, Cal., Agents for the Brunton Patent Pocket Transit. Pacific Optical Co., Los Angeles, Cal., Agents for the Brunton Patent Pocket Transit.

No. 043 BUTTON BALANCE, 10-inch beam. Sensitive to 1-100 Milligramme. This is a double-column button balance with all latest improvements, including our new adjusting device and rider rod lock. It is accurate and as rapid as a beam of this length can be. For an office doing a moderate amount of work, it is the best balance to be had for both gold and silver. For complete description and prices of this and other balances send for catalogue A to Wm. Ainsworth & Sons, (Successors to Wm. Ainsworth.) Denver, Colo., U. S. A.

Ammonia Process.

The practical success of this process is well known and is demonstrated chemically, technically and mechanically in every detail on a large scale. Refractory ores and tailings containing gold, silver, copper and zinc are extracted successfully and profitably. Mail average sample and \$10 and receive full report about the extraction.

Pocketbook, Ammonia Process, full description, \$1.

The Lunkenheimer "Clip" Gate Valve.

Single Disc
DOUBLE SEATED.

Made with Screw Ends from 1/2" to 6",
Flange Ends 2" to 6" sizes.

BEST IN QUALITY.
LOWEST IN PRICE.
THE ENGINEERS' FAVORITE.

These Valves are made of cast iron and all wearing parts of gun metal. They are superior to the common, cheap, brass valves with which the market is flooded.

WHY?

BECAUSE they possess all the advantages of a cast iron pipe fitting (Elbow, Tee, Coupling, Union, etc.) namely—are heavy and rigid—not injured by expansion and contraction or rough handling in pipe fitting. TAKE PRESSURE FROM EITHER END. Body and hub are held together by a steel clip, consequently always easily taken apart. Joint between body and hub made permanent by an imbedded seamless oval copper wire washer. If you desire the BEST, STRONGEST and MOST DURABLE valve for general purposes on all ordinary pressures, use this valve. IT IS A STANDARD FITTING, OF NEAT APPEARANCE and FULLY WARRANTED TO SATISFY. Made also in All Iron for Cyanide and other acids. Specify them and order through your dealer. Write for catalog.

ASSESSMENT NOTICES.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of December, 1900, an assessment (No. 30) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 2nd day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.
Office—320 Sansome street, room 24, San Francisco, California.

SILVER KING MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of December, 1900, an assessment (No. 22) of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 810 Pine street, Room 36, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of January, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 19th day of February, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.
Office—310 Pine street, Room 36, San Francisco, California.

TANANA MINING COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of December, A. D. 1900, an assessment (No. 2) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, Edward H. Stearns, at his office, Room 801 Claus Spreckels Building, Cor. Third and Market Sts., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 6th day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.
Office—Room 801 Claus Spreckels Building, Cor. Third and Market Sts., San Francisco, California.

YUBA RIVER GOLD DREDGING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Smartsville, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of January, 1901, an assessment (No. 2) of three cents (3 cents) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 214 Pine street, Room 29, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

NOTICE OF AMENDMENT OF ARTICLES OF INCORPORATION.

Notice is hereby given that it is the intention of
the JAMISON MINING COMPANY to amend its
Articles of Incorporation by substituting for the
second of said articles setting forth the purposes
of the Corporation, which now reads:

"2nd. That the purposes for which it is formed
are: The acquisition of quartz mines and gravel
mines in the State of California, and to work the
same for gold and silver; also, to acquire, hold
and use water and water-rights and privileges in
connection with such mining; also, to acquire,
hold and use timber lands in connection with
such mining," the following:

Second.—That the purposes for which it is
formed are: To mine for, and to reduce ores
of all kinds; to acquire by location, purchase or
otherwise, to own, hold, work and operate mines
in and throughout the State of California; to ac-
quire by purchase or otherwise, to own, hold, de-
velop, improve, lease, let, mortgage, grant, bar-
gain, sell and convey mines, and mining claims
and properties in the State of California; to ac-
quire, by purchase or otherwise, to borrow, con-
struct, own, operate, lease, let, mortgage,
grant, bargain, sell and convey mills, and other
reduction and smelting works, for the milling and
reduction and smelting of ores, and to deal in pre-
cious metals and minerals and the products of
mines of every kind, and to transport and provide
ways and means to transport the same to market,
and to market and sell the same; to acquire, by
purchase or otherwise, to improve, develop, own,
hold, use, lease, let, mortgage, grant, bargain,
sell and convey real property, lands, water, water-
rights, privileges, and franchises of every kind, in
and throughout the State of California; to buy,
own, hold, sell and generally deal in goods, wares
and merchandise, and all kinds of personal prop-
erty, including the stocks of other corporations,
also bonds, notes and personal securities of every
kind. To establish and maintain agencies of said
Corporation, and to appoint and employ agents,
wherever it may be deemed best, by said Com-
pany; and generally to do any and everything
necessary, proper or expedient to carry out the
aforesaid purposes and carry on the business of
said Corporation.

NOTICE OF STOCKHOLDERS' MEETING.

A Special Meeting of the Stockholders of the
JAMISON MINING COMPANY for the pur-
pose of considering and acting upon the mat-
ter of Amending its Articles of Incorporation,
as above provided, will be held at the
office of the company, room 54, 120 Sutter street,
San Francisco, California, at two o'clock P. M. on
Monday, the 11th day of February, 1901.

By order of the Board at its meeting of Decem-
ber 31st, 1900. SAM W. CHEYNEY,
Secretary Jamison Mining Company.

Patented Dec. 5, 1899; May 29, 1900.

THE DODD CONCENTRATING TABLE,

which we illustrate herewith, is the latest and most improved machine of this class now made.

This type of machine is so well known that little or no description is required. It is specially adapted for ores carrying a heavy percentage of sulphurets; has a large capacity and effects a clean separation.

The operating mechanism can be easily adjusted to meet the requirements of any character or condition of ore; it is simple, durable and efficient, and gives universal satisfaction.

For further particulars, address UNION IRON WORKS, San Francisco, Cal.

S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Books Received; Commercial Paragraphs; Recently Declared Mining Dividends; Obituary, 66-67.

In the annual report of a British Columbia mining company—the Centre Star of Rossland—in the items of expenses for the year is this: "Extralateral litigation, \$30,953.22." This "extralateral" business comes high. Still, there are miners who "can't see why there should be any change in the apex law."

The American Smelting & Refining Co. proposes to increase its capital stock to \$100,000,000. Including the recently absorbed Guggenheim interests, its properties embrace the smelting, refining and electrolytic copper plants at Perth Amboy, N. J.; Pueblo and Leadville, Colo.; Salt Lake City, Utah; Agua Caliente and Monterey, Mexico; one establishment in South America; and lead contracts in each of the three countries mentioned. The aggregate cash and working capital payment to be made by the Guggenheims is \$6,000,000 and \$9,000,000, respectively. The latter's property is figured at \$35,000,000, which would allow \$20,000,000 for plants and good-will.

This paper is apprised that the British South Africa Co., which in some way claims ownership to a part of Africa, has "granted" a little corner thereof, "approximately 10,000 square miles," to "the North Charterland Exploration Co., Limited," and that the latter corporation, having full dominion and power therein and thereby, is graciously pleased to permit prospectors to enter therein. Further information is vouchsafed to the effect that the last named corporation will pay £20,000 "to any person or persons first discovering a payable gold reef or alluvial gold field in its territory," which, taking everything into consideration, would seem to be a good proposition—for the company.

The superior acumen of the Chicago lawyer has again been asserted. Chicago papers have a story of a mining litigation in which the questions of the genesis of ore deposits and the economical extraction of ore were prominent. The counsel for the defendant was suddenly stricken, and an "eminent Chicago lawyer" summoned. Though he had "never been engaged in a mining case before, and knew nothing whatever about mining," he took the case at twelve hours' notice, and "in one night's study mastered every detail of ore deposits and the successful treatment of gold ores." This is, indeed, marvelous, or would be for any one other than a Chicago lawyer. A giant redwood should be plucked from the Sierra foothills, its branches dipped in the crater of the world's most active volcano and the statement out-

lined in letters of livid light on the upcast firmament. That is, if the assertion be correct. Its accuracy will, however, be questioned by 10,000 scientific miners and metallurgists who have labored unsuccessfully for years to partially achieve the alleged results obtained by the Chicago lawyer in a single night.

Bubble "Mining Investments."

And now it is the "Arizona & Montana Development Co." that is being declared a swindle by some of its victimized shareholders, who assert that the promoters and associates have imposed on their confidence to the extent of about one million dollars "treasury stock," sold to them at \$5 per share on a promise of a 2% per month dividend. Five of these dividends were paid; of course, from money realized from the sale of the stock. It is the old story and one that probably will continue during the twentieth century as it did during the nineteenth and all the other centuries. We have little sympathy for those gullible bank presidents and others who bought stock in the high-sounding corporation, and who have lost their money. Doubtless each one of them congratulated himself upon his shrewdness in getting a stock that promised to prove so handsome an investment. This adds but one more to the hundreds of similar schemes which so seriously injure the real business of mining investments. There is no more mining investment about a fraud of that kind than there is legitimate business about a race track wager. Indeed, as between the two, the man who bets on a horse race has a better chance of getting his money back. Equally doubtless, as usual, every one who invested in that corporation scheme is sworn forever against "mining investments," fancying that that is a sample of what a mining investment always turns out to be. The discredit and disgrace inevitably attached to such a concern should not in any way be charged against the district selected by the swindlers as their field of operations, though, unfortunately, every one losing in the latest fiasco will always have a bad word for that section in connection therewith.

It is characteristic of any State or Territory where profitable mining is being carried on to be cursed by several sets of swindlers who make use of the very prosperity of that mining section to float their fraudulent schemes. There are other similar swindling enterprises that are fleecing foolish and ignorant investors out of their money. They are rarely heard of in this west half of America where real mining goes on; their favorite stamping ground is east of the Missouri river. Most of them have some claim to some obscure mining property, and with a glittering prospectus, in which appears prominently an exact statement of the record of some rich mining property in that district and a flattering report from some self-constituted "expert," their agents wheedle money out of the pockets of men who know no more about mining than mining does about them. Usually they begin to investigate after they have "invested."

It is difficult for a mining journal to follow those fellows and still more difficult when found to prove the fraud, and, oftentimes, when that last is done it is a thankless task. The very ones who ask information or seek protection sometimes turn on their honest informant and attempt to shield those who have swindled them. Of course, the bursting of such bubbles as the Arizona & Montana Development Co. should have no effect on legitimate mining investments, but, unfortunately, it is just those things that tend to keep alive the mistaken notion in many people's heads regarding the whole subject of mining investments, forgetting that as in all other profitable and legitimate business industries there are imitators, on the same principle that it is only good money that is counterfeited.

Glimpses of the inside history of some of these swindling mining concerns would furnish interesting reading. It is not infrequently the case that a mining journal, in its zeal to serve the interests of those who naturally look to it for protective information, exposes a swindle, but without immediately accessible direct proof of the fraud, and is at once made the subject of a costly and vexatious libel suit purely for advertising purposes. Indeed the very exposure that would and should ordinarily down a set of tricksters is sometimes used by those fellows as a further means of fraud, by heralding the statement that

"slandorous and injurious statements have been made, but prompt vindication from the malicious libel upon our solvency and integrity will be promptly forthcoming," and the journal making the accusations harassed by shysters of the same class and kidney, who glory in a notice of any kind and make capital of any mention, garbling the language and making condemnation appear as commendation.

REGARDING the statement in last week's issue concerning the free importation of mining machinery into Russia, the facts in detail are that, under an order of the Russian Government, dated Sept. 8, 1898, may be imported free of duty, during a period of ten years, across all frontiers of the Russian empire, for the requirements of Siberian and Ural gold mining, the following: Flash wheels, spouts and water pipes with appurtenances, distributors, and other apparatus for hydraulic placer or surface working; hydraulic elevators for raising gold-bearing sands and deposits; concentrators of all systems for working gold-bearing sands; concentrating appliances for the reduction of slimes and the extraction therefrom of slick and pyrites; apparatus for amalgamating gold-bearing ores, including amalgamators of every description, mills, pans, metallic sheets and other apparatus destined for the extraction of gold by means of amalgamation; apparatus for the extraction of gold by wet process—smelting rotating furnaces of every kind—and other apparatus for chlorinization, viz.: generators for obtaining chlorine, cylindrical plans of boiler and half-boiler iron, and all appurtenances belonging to them, and serving for the extraction of gold by means of cyanide of potassium and other chemical reactors, as also dynamo machines for electrical deposits of gold from cyanide solutions; likewise dredgers and earth-suction machines complete, excavators, diamond drilling machines complete, and perforators of all systems, borers and iron tubes for the same, worked by hand, condensed air or electricity; portable railways, rails, rolling stock for them and wire cables for suspended railways, as also rolling stock for same; pumps of every description, upright, forcing and centrifugal, pulsometers; ventilators of every description; crushing apparatus, pulverizers, stamps, cylindrical mills, runners, sorting apparatus, cylinders, screens, sieves; graders, water motors, steam engines, steam boilers for same, electric motors.

THERE is a commendable promptness in Mexican mining law procedure that is in refreshing contrast to the vexatious and dilatory methods apparent in United States courts. In February, 1900, a San Francisco mining man, plaintiff in a case involving title to Mexican mining property, was notified that the trial would be before the local judge in Concordia, Sinaloa. The case was tried without delay; the plaintiff lost and appealed to the Supreme Court of the State of Sinaloa at Culican, in which tribunal the decision of the trial court was reversed. The defendant appealed to the Federal Court of the district, which affirmed the decree of the Supreme Court of the State. Defendant appealed to the Supreme Court of the City of Mexico. The hearing took place January 5th, that court affirming the judgment of the Federal Court of Sinaloa. This is a record of one Mexican mining case, in which four decisions were secured in eleven months, ranging from the lowest court to the final supreme tribunal. Mining litigants in this country would consider themselves doing well if they got such result in eleven years.

THE advance in technical literature is fittingly characterized at the opening of the century by the appearance of a "historical number" of the Electrical Review, of New York City, an admirable compendium of electrical history and technical information, in the issue of January 12th, which comprises 192 pages. The January issue of the Engineering Magazine of New York is another publication deserving mention. Its 340 pages of finely produced material treat of present conditions and problems regarding equipment, organization and management, and is an inspiration to workers everywhere. Both publications are valuable for present use and future reference, and are monumental in their scope and effect. In each instance a great occasion was rightly utilized to the common benefit of progress.

Concentrates.

CASTOR OIL will keep leather belts soft.

THE deepest shaft in Victoria, Australia, is at Stawell, 2415 feet.

WITH 100 feet head, 50 inches water should give, theoretically, 12 H. P.; about 9½ actual.

GAS does not form in a steam boiler while in use, unless superheated steam be called a "gas."

THE United States ton is 32,000 ounces of 437½ grains each; 2000 pounds troy would contain 11,520,000 troy grains.

STEAM rising from water at its boiling point, 212° F., has a pressure equal to the atmosphere—14.7 pounds to the square inch.

MINE DIVIDEND ANNOUNCEMENTS are published herein as news, without charge, when bona fide and authentically furnished.

THE revised import duty on cyanide of potassium is 12½% ad valorem; 98% cyanide is wholesaled at 28 cents per pound in New York City.

CHAS. F. CHANDLER of the School of Mines, Columbia University, New York City, devised and put into use the assay-ton system of weights.

IN boring an artesian well "solid rock" is technically understood to mean rock which will not cave when drilled, or yield or move under the drill.

THE production of quicksilver during 1899 amounted to 30,454 flasks (\$1,452,745), against 31,092 flasks (\$1,188,627) in 1898, showing a falling off of 638 flasks, but a rise in value of \$264,118.

STEADY progress is made in the work of unwatering the Comstock, Nevada, mines. Ore assaying \$4 per ton is now susceptible of profit. The deepest of the old workings is 3300 feet.

FOR a small affair like a 50 watt dynamo, one giving 5 amperes at 10 volts, or 10 amperes at 5 volts, would be more satisfactory than one giving 1 ampere at 50 volts or ½ ampere at 100 volts.

A HAMILTON-CORLISS condensing engine, diameter of cylinder 12 inches, stroke 42 inches, revolutions per minute 78, steam pressure eighty pounds gauge, would have ninety indicated horse power.

A SLUICE HEAD is 1 cubic foot per second, or 60 cubic feet per minute, about 3750 pounds, so that, theoretically, one sluice head or cubic foot of water per second, falling 8.8 feet, should develop 1 H. P.

IN January, 1881, Lake copper was 19½ cents per pound; in January, 1894, 10 cents; in June, 1894, 9 cents. In January, 1881, lead was 5 cents per pound; in January, 1894, 3½ cents; in June, 1894, 3½ cents, New York.

DISTANCE at which sounds may be heard through rock varies directly with the hardness of the rock and the firmness of the transverse joints. Hammering and drilling have been heard through 180 feet of rock in mines.

IN a big manufacturing establishment the drafting room should take precedence of the machine shop; should have more to say, and its decisions should be final, provided that there are therein designers as well as draftsmen.

A 10-BRAKE horse power gas engine will consume about 3,700 cubic feet air per hour. The exhaust would better be piped from the engine out of the mine. Under ordinarily intelligent management there should be no danger from fire.

WITH a hose 2½ inches diameter, 700 feet long, 60 pounds pressure per square inch at hydrant, nozzle at discharge point 1½ inches diameter, the hose straight and inside smooth, there would be a discharge of 138½ gallons per minute.

IN electrolytic production of copper, brittleness in the product is occasioned by deposition with a weak current from a neutral solution, the copper containing cupreous oxides, if the current is not able to completely decompose the copper sulphate.

A MIXTURE of ten parts of white lead, three parts of black oxide of manganese and one part litharge will stop a small leak in a steam boiler in an emergency for a little while, but the leak itself is evidence of structural defect that needs radical treatment.

CHILE, PERU AND BOLIVIA ship copper, copper ore and copper matte, silver and gold and silver and gold ore to England and Germany for treatment and refining at a charge of from \$20 to \$35 per ton. American smelters have not yet attracted much of that business.

THE only proposed amendment to federal mining laws proposed so far at this session of Congress is one by Senator Stewart of Nevada, prohibiting the location of more than one placer claim on the same watershed and more than one quartz claim on the same lode or vein by one person.

IN a gas engine with diameter of piston 2 inches, stroke 2½ inches, clearance in cylinder equal to one-half the volume swept through by the piston, to give proper compression, the weight of the flywheel, if 15 inches in diameter, should be 113 pounds; if 20 inches, 63½ pounds.

MOLYBDENUM ORE should contain 60% tungstic acid to be marketable, and approximately free from sulphur and phosphorus. The demand is exceedingly limited,

and unless under peculiarly favorable circumstances there is no extraordinary incentive to molybdenite development.

SULPHATE OF ALUMINA is not present in wash water from mechanical filters, unless it be contained in the filtered water used for washing the filters. Hydrate of alumina is the product resultant from the decomposition of sulphate of alumina by lime, and is present in the water and is the active coagulating agent.

WHEN an electric arc is established under water between metallic electrodes such as zinc, lead, platinum, gold or silver, these metals are reduced to an extremely fine powder, which remains in suspension a long time, passing through most filters and giving distinct tints to the liquid. Platinum does not settle for weeks.

A SIMPLE TEST for the purity of manila or sisal rope is as follows: Take some of the loose fiber and roll it into balls and burn them completely to ashes, and, if the rope is pure manila, the ash will be a dull grayish black. If the rope be made from sisal the ash will be a whitish gray, and if the rope is made from a combination of manila and sisal the ash will be of a mixed color.

THEORETICALLY, the power in the water flowing over a dam or fall is found by multiplying the quantity of water in cubic feet per second by the height of the fall in feet, and this product by .1136. To find the available horse power, multiply the theoretical horse power by the decimal representing the efficiency of the water wheel, which, if an overshot wheel or turbine, varies from 45% to 85%.

HIGH ECONOMY may be obtained with almost any type of boiler if it is properly proportioned, if the furnace is of a kind adapted to burn the fuel thoroughly, and if the gas passages are arranged so as to avoid short circuiting. The highest efficiency practically attainable with a properly designed furnace and boiler is about 75%; 55% is probably a fair average efficiency for all boilers in use.

ORE which has to be roasted before leaching does not require pulverizing to such fineness as if leached in the raw state; this applies to either cyaniding or chlorination. A modern chlorination plant is economically adapted to the treatment of large quantities of ore. At a mine with a small output, or where concentrates are to be treated, a cyanide plant of smaller dimensions might be productive of more satisfactory commercial results.

IN the report of the Bureau of Mines of Ontario, Canada, for 1900, J. W. Bain, in treating of the nickel deposits near Sudbury, gives the world's production of nickel for 1898 as being a total of 6116 metric tons, of which Ontario produced 40.8%, or 2503 tons. The remainder came from New Caledonia. Since 1894 Ontario has produced 13,139 metric tons of nickel. Mr. Bain says the Canadian ore averages about 2.51% nickel and 2.92% copper.

MONTANA by legislation defines the status of the miners' inch as follows: A cubic foot of water (7.48 gallons) per second of time shall be the legal standard for the measurement of water. Where water rights expressed in miners' inches have been granted, 100 miners' inches shall be considered equivalent to a flow of 2½ cubic feet (18.7 gallons per second); 200 miners' inches shall be considered equivalent to a flow of 5 cubic feet (37.4 gallons) per second, and this proportion shall be observed in determining the equivalent flow represented by any number of miners' inches.

THERE are several compositions for lining crucibles. One produced by Wm. A. McAdams of New York is said to be of more than ordinary value. One part oxide of copper and four parts oxide of manganese, after mixing, are made into a paste with water, and plastered to a depth of three-sixteenths of an inch upon the inner wall of the crucible. It is first necessary, however, to fuse the oxide of manganese in a temperature of about 2000° C., subsequently reducing it to a fine powder. After the lining has been plastered on as stated, the crucible is dried and baked, the latter process partially fusing the oxide of copper, thus forming a binder between the manganese particles.

THE cost of a diamond drill plant to bore 1200 feet would probably be about \$5000; the cost of working should be under \$4 per foot. According to statistics from various parts of the United States, the cost of boring twelve holes from 200 to 800 feet in length each, totaling 5957 feet, is \$14,839.62, or \$2.49 per foot. This includes labor, superintendence, bits, repairs, water, extras, freight, travelling and carbons. In northern Michigan, two holes totaling 634 feet, two 360, six 1350, two 611, six 1091, or eighteen holes totaling 5048 feet, cost \$2.60 per foot in very hard ground. In Colorado, 567 feet were bored at 44 cents per foot. The cost depends a good deal on the length of standpipe used and other local differences.

IN California the owner of land under which a stream flows can maintain an action for the diversion of it, if such diversion takes place under the same circumstances as would enable him to recover if the stream had been wholly above ground. But for this purpose the underground water must flow in known and well defined channels, so as to constitute regular and constant streams, in order that the riparian owner or appropriator may invoke the same rules as are applied to the surface streams, or otherwise the presumption will be that they have their sources in the ordinary percolation through the soil. Subterranean waters whose channels are unknown

and undefined are classed with percolating waters. The point to be specially noted here is the meaning ascribed to the words "defined" and "known." "Defined" means a contracted and bounded channel, though the course of the stream may be undefined by human knowledge; the word "known" refers to knowledge of the course of streams by reasonable inference.

AMONG the chief considerations in a mortar are its width, measured at the discharge lip, and its depth from that line. The latter can be largely modified by clinch blocks, but the width is relatively a fixed quantity. Greater width reduces scour on inside amalgamating plates, and lowers crushing capacity, lessening the discharge of relatively coarse material, increasing the amalgamating power of the mill, largely because of the improved efficiency of the inside plates. To secure maximum amount of amalgamation inside the battery a relatively wide mortar is recommended, and a shallow, rather than a deep mortar as depth ordinarily favors fine crushing and high amalgamation at the expense of capacity.

BLUESTONE is recovered from the discarded electrolyte in copper smelters and refineries by first boiling the solution in lead-lined tanks with scrap copper, in the presence of steam and air, to neutralize the free acid and increase the copper contents of the solution to the desired degree. It is then pumped up to the crystallizing tanks, in which the bluestone is secured by allowing the copper sulphate to crystallize out on bands of lead suspended in the saturated solution. The mother-liquor siphoned off contains most of the arsenic and antimony originally present in the electrolyte, together with some remaining copper. To recover the latter the mother-liquor is treated in special tanks with sheets of scrap iron. This metal first precipitates out the copper and then the arsenic, a black precipitate being finally secured containing as high as 60% metallic arsenic.

POSTS from 5 to 7 inches in diameter, firmly planted in the ground at the corners and ends of a mining claim, and standing not less than 5 feet above ground, are permanent monuments within the meaning of the Revised Statutes, Section 7324, requiring all records of such claims to contain a description of the claim by reference to some natural object or permanent monument as will identify the claim, and a recorded notice, which, in addition to a reference to such posts, also gives the general direction and distance of the claim from a lake or a river, is a sufficient compliance with the statute. Where there is a conflict of evidence as to which one of two posts is the one set by the locator of a mining claim to mark one of the corners, one of which would exclude and one include the discovery on which the location was based, and the work done by the locator and the official survey for a patent was based on the latter on information by the locator who set the posts, the testimony in favor of that as the true corner which sustains the survey and the validity of the location will be perfected.

REGARDING the bore hole 6571 feet below the surface of the soil, made at Parnschowitz, near Rybrik, Upper Silesia, the hole was 12 inches in diameter at the beginning; this was lined with a tube about 0.4 inch thick; at a depth of 230 feet the bore was reduced to 8½ inches diameter, and thus continued for 351 feet. At this point the blue marl encountered became so compact that a diamond drill had to be used, and under the action of the water the marl swelled to such a degree that the diameter of the pipe had to be again reduced. The greatest difficulty encountered was the great weight of the boring rods, as the depth increased. Though steel was used, at a depth of 6560 feet the total weight of the tools reached 30,155 pounds. Under this weight ruptures of the rods were frequent, and an accident of this nature finally stopped the work; about 4500 feet of rods fell to the bottom, and, being jammed under a part of the tubing, it was impossible to withdraw it. The diameter of the well at the bottom was 2½ inches. Temperature observations made showed 12° C., or 53.6° F., at the surface, and at the depth of 6571 feet the temperature reached 69.3° C., or 157° F., equivalent to an average augmentation of heat of 1° C. for every 34.14 m. of depth.

THE Revised Statutes of the United States—Section 2320—limit a lode claim of mineral-bearing quartz to 300 feet on each side of the center of the vein and 1500 feet in length. Section 2333 fixes the area of a vein or lode claim within the limits of a placer patented to the same person at 25 feet of the surface on each side of the vein or lode. Therefore, a lode claim within the limits of a placer location, patented by a person other than the owner of the placer location, is limited to 25 feet of the surface on each side of the middle of the vein. A placer location confers neither title to nor possession of, nor withdraws from subsequent location by others, known lodes or veins of mineral in place within its limits, under the last section named above, which provides that a placer patent, failing to include a patent for a vein or lode claim known to exist within its limits, shall be deemed a conclusive declaration that the placer claimant has no right to same. Since a placer patent confers no possession to known lodes or veins within its limits, a subsequent location of a vein or lode within the limits of the placer claim is not a trespasser, as against the placer claimant, within the rule of law that a trespasser on a lawful possession can acquire no rights. But a located lode claim is an interest in real property which, as against all but the United States, is treated as a fee, and will support an action to quiet title, under a law authorizing a person in possession of real estate to bring an action to determine adverse claims to same.

Mining Conditions in Korea.

Written for the MINING AND SCIENTIFIC PRESS.

Korea is a mountainous country about the size of the State of Washington, having a rough and forbidding coast line and no rivers of importance. The enormous height of the tides, which on the west coast rise over 30 feet above low water, are a hindrance to navigation and force the ships to anchor usually a long distance from the shore and transfer freight and passengers by small boats. The climate is similar to that of the middle Atlantic States, the temperature rising close to 100° in summer and falling a few degrees below zero in winter. The annual rainfall is not excessive, but the greater portion of it comes in the months of early summer which are known as the rainy season. During this time the rain does not fall incessantly, as is sometimes supposed, but there are many pleasant days. Before the approach of this season the bridges are taken up, to be replaced as soon as the floods have subsided, and traveling in the interior is not pleasant.

The people of the interior are largely farmers, and the river valleys and sloping hillsides are carefully tilled in every available spot, as it is necessary to feed the fifteen millions of population which the country supports. Millet is the farinaceous food staple, but the crops include rice, potatoes, Indian corn, buckwheat, beans, cotton, tobacco, cabbage, turnips and many other vegetables, some unfamiliar to Western eyes.

The native houses are comfortable, picturesque and well adapted to the climate, and the people are peaceable, cheerful and hospitable. They do not all realize the importance of honesty, truthfulness and cleanliness; their ideas of virtue and modesty are not the same as ours; their dress is peculiar, and that of the women and children shocking to American eyes; but, considering their opportunities and the government under which they live, they are a good people.

There are only 17 miles of railroad in the country—a line from the capital, Seoul, to its seaport, Chemulpo. The five open ports are reached by small steamers from Japan, and a little coasting trade is done by native steamers and junks. In the interior the backs of bulls, ponies and men carry most of the commerce of the country. Heavy machinery for the mines is taken up the rivers as far as possible on flatboats and then transferred to heavy native two-wheeled carts, drawn by bulls or cows. These carts are too wide and heavy to cross the bridges, so they must ford the rivers and take their chances on the rough and narrow roads.

Mining machinery comes almost entirely from San Francisco and is of the type common to all our Western gold mining camps. Stamp mills of modern design, driven by Corliss engines, followed by belt vanners, extract the gold from ores drawn by American hoists from mines drained by American pumps. A Korean mining camp is a reproduction of many a scene in the California hills. The buildings are of hewn pine timbers, covered with boards cut by the natives with whipsaws made of the iron bands which come around bales of cotton cloth. Sash and doors are built on the ground by Japanese carpenters. Cordwood for the boilers, brought in on the backs of men and bulls, is cut from the scanty growth on the higher ridges, whence comes also the supply of charcoal for the assay furnaces and the blacksmith shop. Rice, millet and some other articles of food are obtainable in the near-by market towns, but many of the foods craved by foreigners must be specially grown or imported. The rates of ocean freight from San Francisco, New York and London differ but little; so that mining supplies can be drawn from either market, as prices invite. At present dynamite comes from Glasgow, steel from New York and candles from San Francisco, while the lesser wants are mostly obtained from the United States.

The mine and mill superintendents and foremen come from the United States, most of them graduates of well known California mining camps. There are a few foreign mechanics, but the greater part of the skilled workmen are Japanese, who make very good engineers, carpenters and blacksmiths. The staff of accountants and storekeepers is largely composed of young Englishmen and Americans who have been some years in the Orient and are familiar with the people and language. A few Chinese coolies are employed, mostly in outside labor; but the great bulk of the common labor and practically all the mining is done by native Koreans. They take readily to American tools and methods, but it is hard to keep them

steady. To get anything like efficient labor from them requires constant surveillance. When they get a little money ahead, saved from their wage of 25 cents per day, they must quit work until it is spent and they begin to feel the pangs of hunger, when they are again ready for labor. There are some notable exceptions, who are as faithful, honest and efficient men as can be found in any country. Some are shift bosses in the mines, some are acting as interpreters and assayers, and others are running hoists with as great care and freedom from accident as engineers anywhere.

The money of the country is the brass "cash," a small coin with a square hole in the center, roughly cast of varying size and worth about one-twelfth of a cent. The miners are paid in Japanese silver, but the greater part of the supplies obtained from the natives, such as mining timber, building material, charcoal, rice, eggs, etc., are paid for in "cash," and the doing of any considerable amount of business with such cheap and heavy money involves much trouble and expense.

There are no banks and no system of exchange. Bullion must be transported long distances on the backs of ponies before it reaches a port from whence it can be shipped to Japan, where it is marketed. High-grade concentrates are shipped to the United States, while those of lower grade are worked on the ground by the cyanide process.

Not the least among the discomforts of life in such a country for an American is the fact that a trip to the nearest dentist takes two or three weeks and the nearest barber and shoemaker are nearly as far away.

Seoul, Dec. 1, 1900.

AMERICAN MINER.

Relative Heat Conductivity.

TO THE EDITOR:—I am much interested in—although I disagree with—the paragraph in your issue of January 5 comparing the heat conductivity of copper and steel.

As the originator and introducer of aluminum cooking utensils, camp outfits and steam-jacketed kettles, eight years ago, I made a great many experiments in the heat conductivity of metals. I place the heat conductivity of metals as follows:

Silver.....	100
Copper.....	75
Aluminum.....	60
Steel.....	20

While your remarks upon the resistance heat encounters on the water side (when dead) of the plates are correct and substantiated by the vastly higher evaporation in all rapidly circulating boilers, you must admit that the film of burnt gas or soot is the same in both cases—that is, in using either copper or steel plates. Therefore I mean to state that the heat, once past this resistance, will show a far greater advantage than 1% in passing through copper plates, which possess at least three times more heat conductivity than steel plates.

The British locomotive builders still use copper fireboxes and copper tubes, and you will find that their engines burn far less coal per indicated horse power than the American engines.

I don't agree with the statement that thick plates make little difference. I remember having to do with a large boiler once which had a thick, double-riveted seam right in the center of the firebox. The boiler was very hard fired and I was startled by seeing the rivet heads drop off every week as fast as we replaced them, and I should not have dared to run the boiler at all if there had not been a huge stay bolt from end to end, thereby relieving the rivets of part of the longitudinal strain. I soon replaced the two plates with a wide plate and there was no more trouble.

You may be quite sure of one thing: If the effect

of the water could not be felt on the fire side of the rivets, owing to their extreme length, the effect of the fire on the water side of the rivets was equally inoperative to raise steam.

You have a man in San Francisco—Irvig M. Scott—who ought to be able to say whether I am right or not. I can suggest an experiment which will remove all doubts on the subject.

JAS. C. ASHTON.
Highland Park, Ill., Jan. 9.

Largest Coal Conveyor in the World.

At Cape Breton, on the large coal dock of the Dominion Coal Company, the conveyors are in full operation. Loading was formerly accomplished by railroad cars operated on a two-level system of standard gauge double track, the cars being lowered, after emptying on the upper level, by a drop-table.

After being lowered they returned by gravity to the inshore end of the dock. This system worked admirably when there was a full supply of coal in the cars, but was expensive. The Robins Conveying Belt Company designed and carried out the present installation, consisting of a storage of 10,000 tons in bins under the railroad at the inshore end of the dock and mechanical means for carrying the coal from the storage and delivering it simultaneously into three or four hatches of a steam collier lying alongside the dock.

This is accomplished by means of two belt conveyors of large size, the first of which runs through a tunnel under the storage bins, then rises to a height of about 25 feet, at which point it delivers its load to the second conveyor, which elevates the coal an additional height of 35 feet to a point 30 feet above the track level of the dock. At this height it is carried the entire length of the dock, with unloading devices at three or four points, by means of which a part of the coal on the belt can be deflected into chutes which run down to the collier's hatches.

The regular working capacity of the conveyors is 750 tons per hour; this quantity of coal can be carried a distance of 1000 feet and delivered into a vessel without interfering with the former car system.

One of the cuts shows the coal dock with the conveyor structure in place. The interior view shows one of the conveyors in operation, but only partially

Robins Conveyor in Operation.

loaded. It is stated that the total cost of loading the coal by this system, including interest and depreciation, power and labor, is less than one-quarter of a cent per ton.

Coal Dock of Dominion Coal Co. at Cape Breton, With Robins Conveyor.

The Leaching of Copper Ores.

NUMBER II—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by DR. J. OHLY.

As to the erection of a lixiviating plant a gently sloping hillside is always chosen with predilection, so as to allow of the placement of the several circular vats or tanks on succeeding platforms or terraces cut into the hill. The first tank, placed on the uppermost terrace, is usually lined with lead sheeting, and serves as a reservoir for the concentrated sulphuric acid to be added by means of an automatic siphon system to the second tank, which contains the ore covered with water. Such lining becomes a necessity almost, in case concentrated acid is used, but may be discarded entirely on applying chamber acid, which will not affect the inner surface of the tanks to any marked degree. It appears also from observations made by the writer, that the preservation of concentrated sulphuric acid in wooden vats can be successfully accomplished without applying any protective lead sheeting, since the acid merely chars the inner surfaces of the vats, and the carbon layer thus produced forms a good resisting surface against the further action of the liquid. These vats, which usually have the dimensions 4 feet in height by 8 feet in diameter, so as to allow of the treatment of a ton of crushed ore at a time, are heavily hooped and placed on wooden supports, so as to isolate them. Almost any kind of wood, from oak to spruce, will answer for their construction, provided the staves are of sufficient thickness to form a strong and solid wall with steady bottom, so as to allow of a ton charge being made without risk.

The tanks in which the electrolytic separation of the copper is to take place are usually made of wood, also, and are either lined with sheet lead or simply provided with a coat of tar, gilsonite, or elaterite—preferably the latter. The sizes of these tanks vary greatly, however, a depth of 3 feet 6 inches and a breadth of about 4 feet being the most common dimensions. They rest on a wooden trestle, so as to isolate them, and are built sufficiently strong to withstand the outward pressure of the solution and the weight of the copper anodes, cathodes, and conducting rods resting upon them. The anodes, which are made of raw copper, are placed in a row opposite the cathodes, cut of thin sheet copper about 2 inches apart, and both reach within nearly 4 inches of the bottom of the tank, thus leaving sufficient space for the deposition of the slimes.

Under these conditions, and on employing an electromotive force of 0.5 volt., the gold, silver, platinum, tin, arsenic, antimony and lead, eventually present in the solution, pass into the slimes, while other metals are not precipitated from the solution except by prolonged standing after saturation. The most electropositive metals—nickel, cobalt, iron and zinc—are dissolved from the anode at the same time as the copper, but are not dissolved at the cathode on account of the low electromotive force employed. The bath, which is originally formed of an acid solution of copper sulphate or chloride mainly, thus gradually becomes enriched with metals of this group, and, at the same time, becomes poor in copper. Hence, pure copper alone is deposited at the cathode, but the deposit becomes less and less satisfactory toward the end of the operation, so that at a certain moment the solution must be drawn off and replaced by a fresh charge.

The reddish-brown, pulverulent copper which separates out at that stage of the process is caused by the occurrence of a certain concentration of the solution too weak in ions of copper, and, on continuing the action of the current, a point is reached at last where only spongy copper is precipitated. An addition of sulphuric acid in no way remedies this inconvenience, but even tends to favor the formation of spongy copper. The only practicable method applicable consists, therefore, in the withdrawal of the liquid and the precipitation of the copper from it by means of hydrogen sulphide (sulphuretted hydrogen) and to proceed with the electrolysis in a fresh bath. The use of hydrogen sulphide to precipitate the rest of the copper is, furthermore, less expensive than the introduction of anodes, either insoluble or composed of electropositive metals.

It becomes evident, then, from the foregoing that the electrolytic process allows not only of the production of copper of a high degree of purity, but that it also permits the recovery of gold and silver values, besides other metals mentioned above, and incidentally present in the electrolyte.

A Most Surprising Statement.

Job Hedges of Azusa, Los Angeles county, Cal., writes us as follows: "In looking over the Engineering and Mining Journal of May 5, 1900, I noticed an inquiry for complex sulphide tin ore, containing antimony, arsenic, silver and lead, or any of these that can be obtained in large quantities. I would state that my company has immense bodies of tin ore, carrying a large per cent of gold in tellurium form, and smaller percentage of silver-bismuth and arsenic, and perhaps other metals. I would be glad to give any further information desired.—New Zealand Engineering and Mining Journal, Dec. 6, 1900.

Electrolytic Refining.*

In 1889, according to the census, the United States produced nearly 80,000 short tons of fine copper, of which less than 25,000 tons were obtained electrolytically. Only five years later the production of electrolytic copper in the United States alone had risen to over 57,000 tons, or nearly one-third of the world's output at that time, and it steadily increased until in 1900 it reached the total of 211,000 tons, or about 422,000,000 pounds. This is eight times what it was ten years ago and equal to half of the entire copper production of the world.

The estimated daily output of the eleven copper refineries in this country is 579 tons. From the copper treated are obtained gold and silver slimes containing over 53,000 ounces of silver per diem, or over 19,400,000 ounces per annum, besides nearly 174,000 ounces of gold. It thus appears that more than one-third of our total silver output is now derived from copper ores. The cost of refining copper to-day is but half of what it was ten years ago. Contracts have been recently closed for refining copper anodes for as low as \$8 per ton.

The object of electrolytic copper refining is twofold: First, the saving of the gold and silver always found in crude copper, and, second, the separation and removal of the bulk of the impurities, such as antimony and arsenic, from the fine copper, so that the latter will possess a high electrical conductivity and will be suitable for drawing into wire, or pure enough for the various uses for which copper is required in the arts.

There are at the present time only two systems of refining in commercial use—the multiple and the series system. The series or Hayden system is in use at only two refineries, one at Baltimore and the other at Brooklyn, and is only advantageously employed where the crude copper to be refined is of uniform high grade and can be rolled out into smooth, long sheets about $\frac{1}{4}$ inch thick. In the usual or multiple system the anode sheets are cast into plates and not rolled, and they are usually 1 and $2\frac{1}{2}$ inches thick.

As the series system requires a rolling mill, which will consume about one-third of the power of the plant, and a special refining of the crude blister copper to adapt it to rolling, it is not in general use in the United States.

The composition of typical anodes of refined blister copper is as follows: 99.250% copper, 0.338% silver, 0.001% gold, 0.300% oxygen, 0.054% antimony, 0.033% arsenic, 0.009% lead, 0.008% selenium and tellurium, 0.002% bismuth, 0.002% nickel and a trace of iron.

After being electrolytically refined and melted into wire bars and other shapes for rolling and conductivity purposes, the commercially pure electro-deposited copper obtained from such anodes has approximately the following composition: 99.925% copper, 0.001% silver, 0.070% oxygen, 0.002% antimony, 0.001% arsenic and 0.001% lead.

The chief characteristic of modern copper refining in the United States is the introduction and adoption of efficient labor-saving devices, both to and from the melting furnaces and the electrolytic tanks. Thus the largest and probably the best equipped electrolytic refinery in the world, i. e., the Raritan works of the Lewisohn Bros. at Perth Amboy, N. J., is provided with a simple and very effective casting arrangement, in which the molten copper is tapped from the melting furnaces into moulds attached to an endless conveyor, running in front of the furnace, but sunk below the floor level and covered by removable iron plates, so as not to interfere with the approaches to the furnaces in any way.

In the tank-room a full tankload of electrodes is handled at one time by means of a rack-frame and traveling crane, and charged into one of the 1600 tanks in the refinery referred to, or discharged therefrom, as desired. This means a great saving in the labor item alone, besides facilitating very rapid work. Considerable quantities of copper matte and bullion are now shipped from many parts of the world to the United States to be treated, chiefly because refining costs less here than in Europe, due to the capacities, equipment and management of leading electrolytic refineries.

* Titus Ulke, in Electrical Review (condensed).

The Utmost Accuracy Required.

TO THE EDITOR:—In your issue of date Dec. 19, 1900, "Concentrates" says: "A \$20 gold piece weighs 516 grains=1.076 ounces. Of this, 90% is pure gold and 10% copper," etc. In checking up the figures in that paragraph, assuming that the value of one ounce of pure gold is given correctly (viz., \$20.671834625), the actual amount of pure gold in a \$20 gold piece is \$19.999999997, instead of \$19.9981999363, as given. That is, a new \$20 gold piece lacks \$0.000000003 of \$20 worth of pure gold—it is "short" the three hundred millionth part of a cent. This, of course, assumes that there is no error, typographical or otherwise, in the stated value of one ounce of gold—\$20.671834625. I grant you that this is not of great practical importance, but if you insist on having your calculation carried out to ten decimal places, you should have them correct to the ninth figure!

C. J. TILDEN.

New York City, Jan. 19.

Power-House Explosion.*

Five men were killed and seventeen seriously wounded by the explosion of a boiler in the power house of the Northwestern Railway Co., at Kinzie and Kingsbury streets, Chicago, Ill., at 5 p. m. on the 3rd ult. The 10-ton boiler—one of a battery of four in the plant—was hurled through the south wall, crashing through a parlor car in a passenger train outside. The damage done to the power house was about \$55,000; the traffic of the road seriously delayed.

Beside its traction power, the plant furnished energy for the electric lighting of the entire neighborhood, which was instantly plunged into darkness. Thousands of people waiting for trains to get home were delayed for hours and finally compelled to take surface cars, as the cutting off of the power prevented the working of the semaphores and switches, so that every switch had to be worked by hand for three hours after the disaster.

The four return tubular boilers were each rated at 150 H. P. The boiler that exploded was lifted from its setting, flung through the wall and on the other side of the track, 66 feet away. The illustrations on the front page are from photographs taken immediately after the accident and graphically depict the exact appearance of the immediate surroundings. The upper picture to the left shows the wrecked boiler room on one side of the C. & N. W. Ry. tracks, and the exploded boiler on the other side.

There is considerable mystery surrounding the cause of the explosion, the latter being of the most interest to readers of this journal. The boilers were of approved standard make, and in charge of careful and competent men, were subjected to weekly inspection by the owners and every month by the largest and best known boiler insurance company in the country, which carried insurance on them. Each of the boilers was tested to a pressure of 150 pounds; the chief engineer and general superintendent say that ninety pounds was the limit to which they were used. The assistant engineer was a man whose hobby was to keep the boilers full; he says he inspected the gauges three minutes before the explosion, and that they showed plenty of water then. All the men employed were licensed. The superintendent thinks the cause was a probable weakened or rusted plate, so located that it escaped the observation of the inspectors. The illustrations themselves throw some little light on the disaster.

The Engineer, from whom the illustrations were secured, is of the opinion that the initial fracture may have occurred at or near one of the convilinear seams, probably the one farthest from the bridlewall.

The form of longitudinal joint used in these boilers is a strong one under normal conditions of pressure, but, when the plates are torn longitudinally, the cover plates offer no more resistance than any other part of the shell. This may account for the failure of the joint, as indicated by the appearance of the flattened plate. The tendency of boilers at the instant an explosion occurs is to move in the opposite direction from that of the escaping water and steam, the reaction occurring with sufficient force to lift that part, which is free to move far above its foundations. The further fact is pointed out that the flattened plate contains the manhole which is located back of dome, indicating that the initial rupture, where ever it may have started, occurred back of the dome, for it was the forward part of the boiler that landed across the railroad tracks.

The convilinear seam farthest from the bridlewall is subjected to a wider range of temperature than the others; hence, the shell and seams in this region would be more liable to fail, other things being equal, than nearer the bridge, or at the ends of the boiler, and this would be more likely to fail than the longitudinal seam itself in a boiler embodying this construction.

A seam of the style employed in these boilers becomes an advantage only when it is properly made. That a boiler has such a joint is not conclusive evidence that the boiler is any stronger than those employing the more common form of joints. It is seldom that a boiler with butt joints explodes, and, because of this, a definite knowledge of the cause of this explosion would be of value.

In general connection with this entire subject, it is a noticeable fact that steam boilers are the frequent cause of mysterious explosions. If one runs through the records he will find innumerable cases where investigation, inquests and the most searching inquiry have shown that the engineer left the boiler filled to the proper point with water, the fires all right, all parts of the machinery in good working order, and all hands intelligent and alert; and yet, in a few minutes, an explosion has occurred, wrecking the building, killing several people and greatly damaging surrounding property. It is no wonder that so many engineers are superstitious, and think that an engine is sometimes "hoodooed."

The only thing that can in general be said is that such disastrous explosions as the one herein portrayed and described exemplify the necessity for the best of material and shop construction, and the exercise of constant vigilance on the part of the operators and inspectors.

* See illustrations front page.

Sinking Through Quicksand.

TO THE EDITOR:—A short explanation of a method of sinking through a combination of quicksand, water and boulders may be of interest. The object was to get a large amount of water which was known to exist at a depth of about 60 feet. An old well had been put down, the timbering of which resembled a series of boxes, one inside the other, each one smaller than the last put in. Towards the bottom a miner had tried to improve on this method by driving lagging instead of using boxing. This was a failure on account of the boulders forcing in the points of the lagging, so that after two sets had been driven the space at the bottom was reduced to a little over 2 feet. Several oil drillers then tried to get down with a 7-inch casing and drilling rig, but struck hard boulders and quit. The method successfully used was as follows: The depth to water being known to be 60 feet, it was presumed that a depth of 72 feet would give all the water required. A crib made of 3-inch pine boards, laid horizontally, was constructed 8x8 feet in the clear, being built on above ground as the crib went down, each succeeding board being cut shorter, so that the last one on top should measure 5 feet. This would give a shaft 72 feet deep, 8x8 feet at the bottom and tapering to 5x5 feet on top. The excavation being always large enough to allow the big end below to sink, the portion above was continually tending to free itself from side pressure. It was intended to use four jackscrews above to force it down, but this was done by heavy weights to a depth of 60 feet. At that point, as the ground was very treacherous with quicksand and water, another crib was built in the bottom—7x7 feet—built up the same as the other and tapered. This was forced down by jacks bearing against the crib above. The first crib was anchored above to heavy crossbeams by chains to prevent its sinking farther, and the pump—a 6x6-inch Hooker double action—was fastened at its lower end by cross stays, with guides above, also fastened to the crib, for the pump rods from pump to pump jack. The result was entirely successful, and there was practically no hitch from beginning to end. The ground would settle and cave some around the sides of the crib, but interfered very little.

FREDERICK GRUNDY.

Santa Barbara, Cal., Jan. 23.

The McCormick Turbine.

From S. Morgan Smith Co., York, Pa., is received the fourth edition of their illustrated catalogue of their McCormick turbine, manufactured by them, describing that water wheel in detail, giving directions for the construction of head and tail races, setting wheels, tests and tables, details of capacities of different sizes, with prices of from 9 to 24-inch wheels, with rules for water measurement and various tables.

The S. Morgan Smith Co. have furnished several of these wheels to concerns on the Pacific coast. Engravings 18, 19 and 32 of the catalogue represent turbines installed by the Sacramento Electric, Gas & Railway Co. of Folsom, Cal., described herein in full at the time. The plant represented by engraving No. 19 has been in operation six years. Each pair

Vertical Shaft McCormick Turbine.

of turbines develops 1250 H. P., and the main shaft leading from the turbines is directed connected to a 750 K. W. generator. The head of water under which these wheels operate is 55 feet. The turbines represented by engraving 32 develop 1300 H. P. and are operated under about 28 feet head. The company has lately installed for the Boston & Montana

Gwin Mine Cost Sheet.*

Following is the cost sheet of the Gwin mine, Calaveras county, Cal., for the month of July, 1900, furnished by J. J. Crawford, Secretary of the Company:

ITEMS OF EXPENSE.	MINING	MILLING	SULPHURETS
	And transporting to mill 7965 tons.	8000 tons.	Concentration, transportation and reduction charges on 108,545 tons.
	Cost per ton.	Cost per ton.	Cost per ton.
	\$ cts.	cts.	\$ cts.

Assaying		.0028	
Totals		\$0.4313	\$11.694

† Because of the deterioration of the machinery, etc., represented by these accounts, 1% per month of their cost and repairs is inserted in this report.

† The development is apportioned according to the estimated life of that part of the mine affected by it.

* Bulletin No. 18, California State Mining Bureau.

Consolidated Copper & Silver Mining Co. of Great Falls, Montana, a pair of their 54-inch turbines in iron case on horizontal shaft which develop 2800 H. P. under 40 feet head. The power is being used for operating a generator and a large air compressor. The Washington Water Power Co. of Spokane are using two pairs of their 33-inch turbines, each pair mounted in an iron case, the shaft of the water wheels being direct connected to a generator of 1700 H. P. capacity. These turbines operate under 74 feet head. The Walla Walla Gas & Electric Co. of Walla Walla, Wash., are using one of their 27-inch wheels under 90 feet head for operating their electric plant. The Truckee General Electric Co. at Virginia City, Nevada, have a pair of these turbines in use, each of which develops 1400 H. P. under 84 feet head, direct connected to a generator, the power being transmitted to the Comstock mines.

The Bunker Hill & Sullivan Mining Co. of Wardner, Idaho, are using a pair of their horizontal shaft wheels under 55 feet head. The Floriston Pulp & Paper Co. of Floriston, Cal., have in use their wheels aggregating 5000 H. P. under 50 feet head. The Oregon City Manufacturing Co. are using a pair of their horizontal shaft turbines, mounted as shown by engraving No. 33, page 69 of the catalogue. The Willamette Pulp & Paper Co. and the Crown Paper Co. of Oregon City, Or., have a number of their wheels in use. Engraving 34 represents an installation of their turbines near Salt Lake City, Utah.

The Stanislaus Milling & Power Co. of Oakdale, Cal., have recently installed a pair of their turbines under 140 feet head, which are developing 1400 H. P. and are used for operating electrical machinery.

Thos. Prather of Yreka, Cal., is using one of their horizontal shaft wheels under 40 feet head, driving a power pump.

The illustration herewith shows their vertical shaft McCormick turbine. The catalogue will be sent to any address upon request.

Smith-Vaile Direct Acting Pressure Pump.

Herewith is illustrated one of the latest constructed compound direct acting pressure pumps, one of the largest of its type built, and to be installed by the Columbia Gold Mining Co. of Oregon, to be operated condensing. The pump was built for mine station work, the water end being designed for a working pressure of 600 pounds per square inch. The valve seats are of bronze, seating on steel seats located in individual chambers easy of access. The

entire water end is made of a special semi-steel composition. An extension piece is provided with an adjustable shoe for the guidance and support of the plunger. The water plungers are of bronze and of the trombone type and packed, reciprocating through deep glands especially accessible. The entire end is mounted on heavy cast-iron foot pieces. The steam end is of the crosshead type, lagged in polished steel. Steam valves are of the semi-Corliss type, the area ports for the induction and eduction of steam being especially liberal. The valve adjustment is on the outside. Special equalizing valves are provided, and the rock stand supporting the valve gear is located in such a manner as to least interfere with the inspection of the working parts and to obviate any trouble due to vibration. The crossheads are of a special type, being guided on the lower tie rods. The manufacturers are the Stillwell-Bierce & Smith-Vaile Co., Dayton, Ohio, U. S. A.

Mining and Metallurgical Patents.

Patents Issued January 15, 1901.

CRUCIBLE OR RETORT.—No. 665,880; A. A. Crosby, Chicago, Ill.

In apparatus for roasting or smelting ores or like, combination with heating furnace, of crucible located within combustion chamber, adapted to be heated thereby, pipe for introducing hydrocarbon fuel to interior of crucible, supply pipe having portion exposed to furnace heat whereby hydrocarbon is vaporized, delivery end extended into crucible terminating near bottom wall, causing combustible gas to pass upwardly through charge.

TUBE FOR TUBULAR WELLS.—No. 665,886; G. C. Dimock, Newman Grove, Neb.

Combination of earth auger, having stub stem, rotatable shaft operatively detachably connected to stem, opposite annular flanges upon intermediate portion of stem, head loosely receiving stem held between flanges, tubular well-casing inclosing shaft, terminating short of auger, snugly receiving head within lower end, head forming closure for lower end of casing, fastenings driven through casing into peripheral edge of head, whereby latter and casing are fixedly connected, remain stationary, with respect to rotary movement of shaft.

FUME CONDENSING APPARATUS AND FUEL ACCUMULATOR FOR SMELTING FURNACES.—No. 665,919; C. C. Loder, Denver, Colo.

Combination with furnace, of draft chamber connected therewith, cooling device mounted in draft chamber, tank having inlet and outlet passages directly connecting with upper portion, former communicating with draft chamber, tank containing water or solution to level just below passages, vane wheel mounted in tank, closely fitting, means for rotating vane wheel in direction to move vanes through space above water or solution toward exit passage, condensing tank with which last communicates.

ORE CONCENTRATING TABLE.—No. 666,002; W. G. Dodd, San Francisco, Cal.

A reciprocating ore concentrating table having plain or unrifled foot or tail portion, obstructing riffle arranged upon working face of table intermedi-

ate its head end and its plain or unrifled foot or tail portion, riffle being upwardly inclined at its head end and downwardly inclined at its discharge end and having that portion intermediate its upwardly and downwardly inclined ends approximately longitudinal with working face of table, riffle gradually decreasing in height from its head end toward its foot or discharge end.

FLUID PRESSURE HOIST.—No. 665,993; N. A. Christensen, Milwaukee, Wis.

In a hoist, combination of cylinder, piston therein having piston rod with projection on lower end, valve device governing fluid pressure, levers for operating valve to admit or release pressure, depending arm swiveled on valve device with two lateral lugs, lower end of arm arranged in path of travel of projection on piston rod to be raised thereby to cause one lug to contact and move one lever to close valve, device having projection against which other lug strikes to stop downward movement of arm.

CENTRIFUGAL PUMP.—No. 666,023; H. Perry, San Francisco, Cal.

In centrifugal pump, impeller provided with main and auxiliary passages located in spaces between formed by side walls of main passages, inlet way communicating with and supplying water to main passages, balancing chamber of approximately same area as inlet way, opposite inlet way on other side of impeller, in communication with balancing source of pressure, communicating with supplying water to auxiliary passages in impeller.

METALLURGICAL FURNACE.—No. 666,155; A. Reynolds, Sheffield, England.

Metallurgical furnace having therein vessel to contain mineral or metal treated, vessel having end walls supported against furnace casing, and unsupported side walls curved inwardly, means for directly heating side walls.

PROCESS OF ELECTROLYTIC PRODUCTION OF NICKEL OR ALLIED METALS.—No. 665,915; M. Kugel, Berlin, Germany.

Process for electrolytic production of tough, rollable nickel and allied metals, consisting in subjecting same to action of an electric current, in an electro-

lyte, temperature of which is over 30° Centigrade, keeping electrolyte acid by addition of strong mineral acid not chemically changeable by current, and adding highly concentrated solution of light metal salt not changeable by current, to facilitate maintenance of uniform acidity without addition of more acid.

CRUSHER.—No. 666,129; E. D. Chester, London, England.

Combination with upright gyratory spindle and crushing cone carried thereby, of means for supporting vertically adjusting one within crushing hopper or concave of machine to vary size of fragments produced by machine while latter is at work, means comprising foot step bearing for gyratory spindle, vertical shaft supporting bearing; vertical guide sleeve for shaft fixed to framework of machine; box carrying step bearing for shaft mounted upon rollers supported adapted to run upon helical rib in one with guide sleeve; casing rotatably slung from framework of machine externally adapted to afford freedom of vertical but not of rotary movement relatively to casing; means for rotating casing so that rollers may be caused to ascend or descend upon helical rib to adjust level of crushing cone while machine is in operation.

Smooth-On Iron Cements.

The Smooth-On iron cements are used for so many purposes that it may be interesting to know about them and some of their uses. These cements are prepared in powdered form and packed in one, five and twenty-five pound tin cans, in which they can be shipped to any place. The Smooth-On iron cements No. 1 and No. 2 are made especially for and used by marine and stationary engineers—No. 1 for repairing leaks or making connections on steam or hydraulic work and No. 2 for coating the inside seams and rivets of leaky steam boilers. It can be applied with a brush.

To apply these cements they are mixed with water according to the directions on each can, and in a short time the material hardens, becoming as solid iron. During the process of hardening the cement expands slightly, and by this action becomes valuable for mechanical uses. When hard Smooth-On is insoluble in water, steam or oil, and it will withstand a red heat; its conductivity is the same as iron.

The slight expansion of Smooth-On iron cement when hardening causes it to fill a hole or opening to which it is applied. In metal ship building, steam engine and boiler building, under steam boiler patches, mainstay brace and stayscrew nuts and for making permanent joints on flanged or screw-thread joints, where exposed to high temperatures and pressures, it is of value. The following is one of such repair jobs made with Smooth-On compound:

Mr. Vreeland Tompkins, Chemist, Jersey City, N. J.—
DEAR SIR: I am happy to state that your Smooth-On compound proved a perfect success on a very bad joint I had on the dome of our boiler, from which a great many branches run. It would have cost from \$12 to \$15 to take the header off and make an ordinary joint. I simply took the engineer's packing hook and picked out a part of the old joint, which was about 3/4 inch thick, for 1/2 inch inside of the edge of the flange all around, and put in your compound. It took a man one and one-half hours to pick out the part of the old joint and one-half hour to mix and put in your compound, which he did with a common table knife, and to our surprise next morning we had a perfectly tight joint. I must say that it is the best and handiest thing for the purpose that I ever saw, and would recommend every engineer troubled with leaks to give it a trial. Yours truly,

WILLIAM MCILVRID, Supt.

240 Eleventh St., Jersey City, N. J.

The manufacture of the Smooth-On iron cements is under the supervision of a chemist. For further particulars apply to the Smooth-On Mfg. Co., Jersey City, N. J., or to Messrs. Madison, Bruce & Sellers, 34 Steuart Street, San Francisco, Cal.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

E. N. Carpenter reports provisions scarce at Circle City, owing to severity of the weather; no work is being carried on.

ARIZONA.

COCHISE COUNTY.

The new 350-ton hot-air smelting furnace now being put in by the Copper Queen Co., at Bisbee, will be in operation next month.—The Lowell & Arizona M. Co. has resumed operations.

Supt. Henry is pushing work on the Black Diamond, near Dragoon. The lower tunnel will cut the ore body at 500 feet depth.

GILA COUNTY.

Lawrence Bros. are sinking on the Glisan & Lawrence property, near Dripping Springs.

The Old Dominion reports a 25-foot vein of sulphide ore running 13% copper.

GRAHAM COUNTY.

Work on the new smelter, near Clifton, is progressing.

MARICOPA COUNTY.

Gray Bros. are operating the Lookout claims, near Phoenix.

MOHAVE COUNTY.

The Fairfield, at Rawhide, is shipping ore and concentrates; F. Cofer, owner.—Ore is being mined on the Midas and Friends mines, in Aubrey district; product will be run through the Tremain mill recently put in on the Midas.—J. Haas is pushing work on his turquoise mines at Mineral Park.—The McCracken, 12 miles west of Signal, is being examined by Eastern buyers.—Supt. Blandy will soon begin operations on the Elkhart, at Chloride.—The Lucky Boy, Supt. F. W. Stull, is shipping ore.—Good ore is being taken out at the Mollie Gibson; Foreman Grant.—F. W. Theis has bonded the Silver Age.—H. N. Botsford, in charge of the erection of the Tennessee mill, Kingman, says it will run next month.

PINAL COUNTY.

A vein of black oxide of copper ore 2 feet wide is reported opened on the Black Diamond, at Silver King; H. Lampker, owner.—The old Pinal Con. mines, near Florence, may be reopened. Tunnel No. 2, on the Golden Quiver at Mineral Hill, now in over 100 feet, will be extended; sinking of the shaft on the Silverado will be continued.

SANTA CRUZ COUNTY.

The Bland, in the Santa Rita mountains, 10 miles west of Patagonia, is shipping ore.

YAVAPAI COUNTY.

Sinking on the Crown Point, near Prescott, will be resumed; a pump is going in, and water will soon be pumped out. The ore runs from \$12 to \$15 to the ton; A. O. Brodie, Supt.

The shaft on the Cypress, in Big Bug district, near Prescott, is down 225 feet; Mayer, Thornton & Kingsley, owners.—G. H. Swartz has sold his placer property, at Mayer, to M. Lester of Colorado for \$10,000. Mr. Lester will put in new machinery.—Ore from the Jack Redding group, 4 miles south of Mayer, runs 24.10% copper, \$2 gold and \$2 silver to the ton.—The Mizona Mineral Co., B. Blanchard Supt., has sunk two 100-foot shafts on the Iron King, in Big Bug district.—The Red Rock, on Upper Big Bug, at Providence, is sold to Mr. Powers of Jerome, representing Boston men, for \$125,000; property is equipped with 10-stamp mill, concentrating plant and pipeline.—The Keystone C. & G. M. Co. is taking out copper-sulphide ore from the 200-foot drift in the Keystone, at Gilbert; more men will be put on to build the new cut-off road, which will save 2 miles of hauling.—The Mizona Mineral Co. has sold to New York men the Scycoc and Gold Van mining claims, in Big Bug district, for \$27,000.

CALIFORNIA.

ALAMEDA COUNTY.

The Justinian Calre Co. of San Francisco will work the Merchant manganese and magnesite deposits near Livermore.

AMADOR COUNTY.

A new tunnel is being run on the Madrone at Golden.—The Deadsheep will resume operations early this spring.—On the Modoc a new tunnel is run, tapping a 3-foot ledge of good milling ore.—Work on the Defender is progressing; the ledge at the 300-foot level is from 7 to 10 feet wide; about one-half of ore mined is shipping ore, while balance is milled on the ground; product of the mill exceeds all expenses.

CALAVERAS COUNTY.

On Six Mile creek, near Angels, Rich-

mond & Shepherd are developing a new quartz lode.

CONTRA COSTA COUNTY.

The General Gleaves Oil Co. has its rig in place and will begin drilling soon.

EL DORADO COUNTY.

The mineral products of the county are gold and silver, lime, stone and slate. The total value of the mineral products of this county for the three years ending December, 1899, was \$1,622,958. Of this sum the value of the gold product was \$1,581,089. In the spring of 1900 there were twenty quartz mines, two drift mines and one copper mine in operation, also thirteen mills and one cyanide plant.

The St. Clair, at Kelsey, is running. The German, at Placerville, will be reopened.

The Superior Court has confirmed the sale of the interest of the Melton estate in the Gentle Annie mine and other mineral properties to Thomas Clark for \$55,000.

FRESNO COUNTY.

The mineral products of the county are gold and silver, copper, petroleum, gypsum, brick and mineral water. The total value of the mineral products for the three years ending December, 1899, was \$812,625. The gold and copper mines are in the eastern portion of the county, which extends into the Sierra Nevada mountains. In March, 1900, there were five gold and four copper mines in operation and numerous other claims on which assessment work was being done. The petroleum industry is the most important mineral industry in the county. The oil fields are situated in the foothills of that portion of the Coast Ranges which is situated in the western borders of the county. In September, 1900, there were eight companies producing oil in the county, and many prospect wells were being drilled. The value of the petroleum product of the county for the three years ending December, 1899, was \$664,212.

KERN COUNTY.

The mineral products of the county are gold and silver, borax, antimony, Fuller's earth, asphaltum, petroleum, coal, lime and brick. The total value of the mineral products of the county for the three years ending December, 1899, was \$3,088,543, and of this amount the value of the gold product was \$2,635,657. The mineral deposits of the county are distributed not only throughout the crystalline rocks of the higher mountains, but also through the sedimentary formations which form the foothills bordering the valley lands. The mineral deposits of the crystalline rocks are represented by the gold mines of the Kern river basin and of the Caliente district in that portion of the Sierra Nevada mountains which lies to the north of Tehachapi, and by the mines of Randsburg district, which lies to the south of that range. Some good prospects have also been discovered near Rosamond, a short distance from the southern boundary line of the county. There are also deposits of antimony and copper. The mineral deposits of the sedimentary rocks are those of petroleum which have been discovered in the Tertiary rocks forming the foothills on both sides of the San Joaquin valley. Indeed, these discoveries may be said to be the most important events in the mining history of California for the years 1899-1900. During the past five years the most important feature in gold mining in the county has been the growth and development of the Randsburg district, although there has of late been an increased activity among the mines of older districts which had previously been idle for many years. The deposits of petroleum before referred to are those of the Kern river district, on the eastern side, and of the McKittrick and Sunset districts on the western side of the San Joaquin valley.

A 10-stamp mill may be put in on the Jennie B. in the Slate range, near Randsburg; Stanley & Hushfeld, owners.

The Peerless Oil Co., operating on 31, 28-28, 3 miles north of Bakersfield, is producing 1000 barrels oil per day; a 7½-inch pipe line, 1½ miles long, was recently put in to connect wells with the railway, and a 10,000-gallon storage reservoir is just completed; two drilling rigs are kept in operation constantly; the company reports a shortage of tank cars in the district generally.

LAKE COUNTY.

The mineral products of the county are quicksilver and mineral water. The total value of these products for the three years ending December, 1899, was \$517,330. Of this sum the value of the output of quicksilver was \$327,471.

LASSEN COUNTY.

The mineral products of the county are gold and silver, the total output of which during the three years ending December, 1899, had a value of \$116,608.

LOS ANGELES COUNTY.

The mineral products of the county are

gold, gypsum, infusorial earth, petroleum, building stone, brick, pottery and mineral water. The total value of these mineral products for the three years ending December, 1899, was \$5,108,895. Of this sum the value of the petroleum output was \$4,199,238. During the past three years the oil fields of the county have yielded more than half the entire petroleum output of the State of California. Gold mining has been carried on for many years in the county, but the output of precious metals has been small.

MADERA COUNTY.

The eastern portion of the county extends into the Sierra Nevada mountains, and is largely devoted to mining. The mineral products consist of gold and silver, copper, granite and brick. The total value of the mineral products of the county for the three years ending December, 1899, was \$387,954. Of this sum the value of the output of gold was \$254,605. Madera county is the second largest producer of granite in the State, the value of the total amount of granite produced during 1897-1898-1899 being \$122,888. In 1900 there were twenty gold mines and one copper mine in operation, and there are a large number of mines on which assessment work is being done. Copper mining promises to be an important industry in the county, and a 100-ton smelter has been erected at Madera.

MARIPOSA COUNTY.

The mineral products of the county are gold and silver and slate. The value of these products for the three years ending December, 1899, was \$1,355,134. Of this amount the value of the output of gold was \$1,350,674. In August, 1900, there were ten quartz mines and one hydraulic mine in operation, also three stamp mills and one compressor plant.

MONO COUNTY.

The mineral products of the county are gold and silver, lead and lime. The total value of these products for the three years ending December, 1899, was \$867,457, of which sum \$1,663,187 represented the value of the output of gold. In June, 1900, there were thirteen gold mines and four cyanide plants in operation.

Power drills were recently put in at the Castle Peak mines, near Bodie; a strike was recently made in a crosscut being run; ledge opened up is 8 feet 2 inches wide, and ore is said to run about \$30 to the ton; Supt. Kermeen.

MONTEREY COUNTY.

The minerals produced in the county during the three years ending December, 1899, were mineral waters, stone, brick and asphaltum. The total value of the products for the three years mentioned was \$38,693. In 1900 there was considerable prospecting for petroleum, and some oil was struck in the Cholame valley. In the autumn of 1900 the coal mines in Stone's canyon, near the eastern line of the county, were reopened.

NAPA COUNTY.

A new quicksilver mine is reported discovered in the northern part of the county by D. H. Thorne. San Francisco capital is stated to have bonded the mine for \$100,000.

The mineral products of the county are quicksilver, mineral water and magnesite. The total value of the mineral products of the county during the three years ending December, 1899, was \$1,812,754. Of this sum the value of the output of quicksilver was \$1,531,047. In the spring of 1900 there were four quicksilver mines in operation.

NEVADA COUNTY.

The mineral products of the county are gold and silver, copper, mineral paint and granite. The total value of these products for the three years ending December, 1899, was \$6,200,069. Of this amount the value of the output of gold was \$6,074,389. In April, 1900, there were about seventy active mines, twenty-three stamp mills, one combined smelter and chlorination plant, twenty-nine concentrators, two chlorination works, one canvas plant, one slimes plant, one Huntington mill, six compressed air plants. Nevada county is the leading gold and silver producer in the State, and in the past three years has produced considerable copper.

In the Posie, near Willow Valley, a tunnel is being run to tap the pay shoot, which some time ago yielded ore running \$65 per ton.

At Grass Valley 8000 feet of pipe line for the Empire M. Co. is laid.

The shaft at the Coe is repaired and work resumed.

Good ore is being taken out at the old Nevada, near the suspension bridge, at Nevada City; an incline shaft is being sunk.

PLACER COUNTY.

The mineral products of the county are gold and silver, granite and pottery clay. The total value of the minerals for the three years ending December, 1899, was

\$4,291,974, of which sum the value of the gold output was \$4,113,044. The forthcoming report shows twenty-two mines and about fifteen granite quarries in active operation. There are four stamp mills.

The Valley View, at Mt. Pleasant, is closed down temporarily.

PLUMAS COUNTY.

The mineral products of the county are gold and silver, the output of which during the three years ending December, 1899, was \$1,090,728. In May, 1900, there were in operation twenty-seven quartz, nine drift, six placer, four hydraulic and two copper mines.

RIVERSIDE COUNTY.

The mineral products of the county are gold and silver, mineral paint, asbestos, quartz sand, coal, salt, pottery, brick, granite and lime. The total value of these products during the three years ending December, 1899, was \$707,892. Of this sum the value of the gold output was \$499,425. In the spring of 1900 there were nineteen mines on which more or less work was being done, several of which were in active and continuous operation.

SACRAMENTO COUNTY.

The mineral products of the county are gold, granite, natural gas, macadam, paving blocks, marble, brick and pottery. The total value of these products for the three years ending December, 1899, was \$566,856. Of this amount the value of the gold product was \$266,257. The gold mines are in the vicinity of Folsom, where there were more than nine placer and drift mines in operation in September, 1900. The granite quarries are at Folsom Prison.

SAN BENITO COUNTY.

The mineral products of the county are quicksilver, mineral water, gypsum, oil, asphaltum, lime, macadam and coal. The total value of these products for the three years ending December, 1899, was \$661,503. Of this amount the value of the quicksilver output was \$570,185. In 1900 several new quicksilver mines and one copper mine were opened. In September of that year more than twenty companies were prospecting for petroleum, with satisfactory results.

SAN BERNARDINO COUNTY.

The mineral products of the county are gold and silver, copper, borax, cement, lime, brick, granite, stone, paving blocks and marble. The value of the total product of these minerals for the three years ending December, 1899, was \$4,816,283. Of this amount the value of the output of borax was \$3,306,000 and of the output of gold \$526,484. In April, 1900, there were thirty-seven quartz, five copper and five borax mines in operation.

At Copper Camp, 18 miles from Manvel, J. M. Kennedy is opening up properties for Salt Lake, Utah, parties.—The Kempe & Thomas mines, near Sandy, are shipping silver and lead ore.—A tunnel is being run on the Tam O'Shanter (silver-lead).—On the Green Mountain group (copper and silver-lead), belonging to the Hearst Estate, a depth of 200 feet is attained. Drifts show copper ore bodies; Supt. F. O. Wilkinson.—The Potosi mines (silver-lead), recently incorporated at Los Angeles, are about 60 miles from Manvel.—J. B. Osborn, operating the Gun Sight, is shipping ore regularly. The ore is said to run 30% lead and from 30 to 50 ounces silver to the ton, it being hauled 100 miles.

SAN DIEGO COUNTY.

The mineral products of the county are gold and silver, lead, copper, salt, lithia mica, granite, rubble rock and mineral water. The total value of these products for the three years ending December, 1899, was \$1,702,201. Of this amount the value of the output of gold was \$1,599,174. In the spring of 1900 there were twenty-two quartz mines, at which work was more or less actively prosecuted, and one copper mine had been opened.

I. Trumbo reports 140 stamps dropping at the Gold Crown, at Hedges; 300 tons of tailings daily are being treated by the cyanide plant; preparations are being made for the use of oil as fuel at the mine; prospecting for the copper-bearing zone is in progress and the latter is expected to be reached at a depth of about 1500 feet.

SAN JOAQUIN COUNTY.

The mineral products of the county are natural gas, brick and manganese. The total value of these products for the three years ending December, 1899, was \$282,580. Of this amount the value of the output of natural gas was \$199,580. In January, 1900, there were ten productive gas wells in the city of Stockton.

SAN LUIS OBISPO COUNTY.

The mineral products of the county are gold, quicksilver, copper, bituminous rock, asphaltum, granite, rubble rock, marble, brick and mineral water. The total value of these products for the three years ending December, 1899, was \$180,831. In

August, 1900, there were four quicksilver mines in operation, and several companies were prospecting for oil, but no remunerative wells had been obtained.

SANTA BARBARA COUNTY.

In the suit of the San Francisco Savings Union, plaintiff, against the R. G. R. Petroleum & M. Co., defendant, Judge W. S. Day, in the Superior Court of the county, renders decision in favor of plaintiff: the issue was whether property abutting upon an ocean frontage controlled such frontage, including the tide water and the ocean bed beyond. The plaintiff owns a piece of land at Ortega Hill, just west of the main oil field at Summerland. This property runs down to high water mark. The defendants put up a platform off the property and proposed to erect a wharf for oil purposes, claiming to hold under rights given by the Secretary of War. The plaintiff asked an injunction against further operations.

The mineral products of the county are gold, asphaltum, natural gas, brick and mineral water. The total value of these products for the three years ending December, 1899, was \$1,272,694. Of this amount the value of the output of asphaltum was \$790,560 and of the oil output \$433,973. In June, 1900, practically all the productive oil wells were at Summerland. The asphaltum is obtained from the mines owned and controlled by the Alcatraz Asphalt Refining Co. and from the Goleta asphalt mine, owned by J. F. Moore.

SANTA CLARA COUNTY.

The mineral products of the county are quicksilver, mineral water, oil, asphaltum, brick, limestone, macadam, manganese, magnesite and pottery. The total value of the mineral products for the three years ending December, 1899, was \$1,028,588. Of this amount the value of the quicksilver output (all from Almaden mine) was \$590,470 and of the brick output \$340,945. The oil fields of the county are situated in its western borders.

SANTA CRUZ COUNTY.

The mineral products of the county are lime, bituminous rock, limestone, sandstone, macadam, gold and granite. The total value of the mineral output for the three years ending December, 1899, was \$764,969. Santa Cruz county produces nearly, if not quite, as much lime as is produced in all the other counties of the State and leads in the production of bituminous rock. During the first half of 1900 there was some prospecting for oil in the north-eastern part of the county.

SHASTA COUNTY.

The mineral products of the county are copper, gold and silver, structural material and mineral waters. The total value of these products for the three years ending December, 1899, was \$3,861,448. Of this sum the value of the copper output was \$6,030,853 and of the gold output \$2,302,970. In 1897, Shasta county advanced to the position of the leading mineral producer of the State, and in 1898 and 1899 not only maintained, but largely increased its lead. Until 1897 the chief mineral products of the county were gold and silver; in that year copper was added, and to the production of that metal the increasing of the total output was chiefly due.

The Snow Cloud, Desert Crescent, and Desert Jumbo mines, etc., near Cottonwood, containing five acres with water rights, are reported sold to Dafflemeyer & Stewart for \$4000.

The new DeLamar smelter at DeLamar is about ready; it is estimated that a charge of ore can be roasted in twelve days; after first charge is drawn the smelting furnace will be blown in; men are now taking out iron and lime for fluxing purposes near the mouth of the McCloud, on Pit river; a 4-mile road is built, connecting with the Copper City road at the Silverthorn ferry; it is probable the company will build a railroad to connect with the main line during the present year. It is reported that the Bully Hill management contemplate increasing smelting capacity to 500 tons daily. The Michigan group, on Bully Hill, adjoining the DeLamar, may soon become the property of Capt. DeLamar. On the Sybil, near French Gulch, a 700-foot crosscut tunnel has cut three veins, all showing good ore; a recent shipment of ore returned \$300 to the ton; G. A. Von Krunze, W. B. Murdoch and A. Rossi, owners. The Midas, in Harrison gulch, was closed down recently owing to a heavy storm; it is estimated that the January output in consequence is cut down about \$10,000; ordinary monthly output is \$40,000. Work on the Three Sisters, near French Gulch, recently bonded to San Francisco men, will probably be started up soon.

E. D. Blowers, J. A. Drennan and E. J. Stusse have bonded to J. De Lamar the Hotchkiss, Shadyside, Sunnyside and Lydia mining properties in the Pittsburg mining district for \$11,000—the first payment, \$5000, to be made November 23rd,

the necessary assessment work to be done by the bondee during the life of the bond.

SIERRA COUNTY.

The mineral products of the county are gold and silver. The total value of the output of these products for the three years ending December, 1899, was \$1,220,310, and of this amount the value of the gold output was \$1,219,386. In July, 1900, there were in the county forty-five quartz, twenty-two placer, eighteen drift and ten hydraulic mines, most of which were in active operation.

SISKIYOU COUNTY.

The mineral products of the county embrace gold, silver, copper, mercury, chromic iron and building material, the chief industry of the county being gold and silver mining. The total value of these products for the three years ending December, 1899, was \$2,603,153. Of this sum the value of the gold output was \$2,602,698.

At the Gold Ball, in Salmon River district, fifty men are working; the 20-stamp mill is running; owners expect to crush 6000 tons of ore this season. The Gold Run, A. Dannenbrink Supt., is handling twenty tons of ore per day; twenty men are employed. Ore from the Polar Bear, near Callahans, is said to run 20% copper to the ton. An 8-foot vein of high-grade copper ore is opened up on the Bunting, of the Bunting Copper M. Co. The snow fall in this county so far this winter is unprecedented; it has reached 4 feet on the level, while mountain points report a fall from 12 to 20 feet in depth.

Stallcup Bros. are making preparations to put in hydraulic pipes at Henley to work their property with giants; they have an abundance of water.

J. O. Welsh of Mott is putting up a 10-stamp quartz mill on French creek, Scott valley.

SONOMA COUNTY.

The mineral products of the county are quicksilver, magnesite, mineral paint, mineral water, macadam, paving blocks, granite and rubble rock. The total value of these products during 1897, 1898 and 1899 was \$395,836. Of this sum the value of the quicksilver output was \$228,980. In the spring of 1900 there were three quicksilver mines in active operation.

TRINITY COUNTY.

The mineral products of the county are gold and silver, quicksilver and granite. The total value of these products for the three years ending December, 1899, was \$2,834,325. Of this sum the value of the gold output was \$2,528,137; of the quicksilver output, \$304,154. In point of numbers the placer, hydraulic and drift mines of the county far exceed the quartz mines, but in the past three or four years there has been increased development of quartz mines and several have proved very remunerative.

The Zoellner, 6 miles northwest of Lewiston, is bonded to San Francisco men. The Union Mutual M. Co., capital \$750,000, is organized to work the mine.

TULARE COUNTY.

The mineral products of the county are gold and silver, copper, chrysoprase, granite, lime and brick. The value of these products for the three years ending December, 1899, was \$59,254, the value of the gold being \$38,840. In February, 1900, there were eight gold and three copper mines, at which more or less work was being done.

TUOLUMNE COUNTY.

The mineral products of the county are gold and silver and brick. The total value of the output of these products for the three years ending December, 1899, was \$5,219,883, the value of the gold output being \$5,180,294. In August, 1900, there were twenty-two mines in operation, eighteen stamp mills, three electric plants, three chlorination works, five cyanide plants, two slimes plants, four compressor plants; estimated number of men engaged in active mining, about 1100.

The Collier stamp mill, in Collierville district, is running on ore which assays \$100 to the ton, and the supply of which is said to be large.

Sufficient ore is being mined at the Grizzly, Sonora, to keep the mill running one shift each day. The Hopeton is unwatered and work on the upraise is in progress. At the Ribbon Rock the 10-stamp mill is running; the shaft is down 250 feet.

The Street, at Tuttle town, owned by F. Sutton, is bonded to R. Kinsman and others of Oakland; mine is being unwatered. The Longfellow, at Big Oak Flat, continues shipping ore; ten stamps will be added to the mill. The mill on the Hope is again in operation. Ore running from \$100 to \$150 per ton is reported at a depth of 320 feet in the Goldwin; Supt. W. H. McClintock.

This week the first carload of granite ever shipped from the county went over the Sierra Railroad line. Twenty-five tons from a quarry near Soulsbyville were

consigned to A. H. MacNutt, Pres. California Marble, Granite & Sandstone Dealers' Association at San Francisco.

VENTURA COUNTY.

The mineral products of the county are gold, borax, petroleum, asphaltum and brick. The total value of these products for the three years ending December, 1899, was \$1,635,795. Of this sum the value of the petroleum output was \$1,435,482. In June, 1900, there were about 206 productive wells in the county, and numerous prospect wells were being drilled. In 1898 valuable deposits of borate of lime were discovered in Lockwood valley in the eastern borders of the county.

YUBA COUNTY.

The mineral products of the county are gold and silver. The value of these products for the three years ending December, 1899, was \$498,442. Of this amount the value of the output of gold was \$498,430. In May, 1900, there were four quartz, two placer and one hydraulic mine in operation; dredge mining is also reported.

COLORADO.

BOULDER COUNTY.

Sinking is in progress on the Annie Loel at Ward. A shaft is being sunk and a tunnel is being run on the Golden Fox. The tunnel in the Baltimore Belle is being timbered. When completed the mine will be worked through this tunnel. The shaft on the Fourth of July at Eldora will be sunk to 260 feet. The Shannahan coal mine, near Boulder, owned and operated by H. Linkletter, is running steadily. By a continuance of operations during the coal strike, it has probably averted a coal famine in and around Boulder.

CHAFFEE COUNTY.

Driving of No. 2 tunnel on the Tasmania at Winfield is in progress. On the Vindicator No. 1 H. Munro is opening up pockets of good ore.

CLEAR CREEK COUNTY.

The Georgetown M., T. & T. Co. is incorporated, with \$500,000,000 capital; D. B. Ellis, T. Holland, B. F. Kelly. The Empire T. & G. M. & M. Co. is incorporated; F. A. Maxwell, F. P. Dewey, V. G. Hamill.

The air receiver at the Mayflower, Idaho Springs, exploded recently. A new one was put in immediately. The tunnel is being driven. The ore body is found to be steadily widening.

EL PASO COUNTY.

The new chlorination plant at Colorado City, costing \$750,000, is ready to reduce ores.

GILPIN COUNTY.

The Gold Dollar, at Central City, is closed down, owing to a scarcity of coal.

HINSDALE COUNTY.

At Lake City the Golden Fleece tunnel is in 2200 feet.

LAS ANIMAS COUNTY.

The Red River Copper Co. has started operations on its property near Trinidad.

SAN JUAN COUNTY.

The 200-foot tunnel on the Mayflower, in Burro gulch, near Gladstone, is in good ore. Noll & Berquist, owners, expect to put on ten men. The Minnie Gulch M. & T. Co. is framing timbers for another ore-house which will go in at tunnel No. 2; eighty men are employed. Ore hauling from the Henrietta to the smelter is suspended for the winter. The tunnel on the Ninety-Six is in 356 feet, and the face shows improvement in the grade of ore. The crosscut tunnel being run to tap the La Plata mine will also tap the Tornado; the crosscut is in 350 feet. Drifting is in progress in the lower workings of the Sioux M. Co.'s properties, at the mouth of Picayune gulch. A mill will probably be built on the property this summer; Manager Condit.

SAN MIGUEL COUNTY.

At Telluride work on the Meldrum tunnel will start February 1st.

TELLER COUNTY.

The Golden Cycle, at Cripple Creek, is producing 125 tons of ore per day. The Amanda, at Windy Point, is equipped with an electric hoist. The shaft on the Triumph, now down 310 feet, will be sunk an additional 100 feet. The Mackin No. 2 lease on the Lucky Guss is making a regular production of fifty tons of ore per week; ore runs about \$200 to the ton. Stopping is under way in the fifth level of the Theresa, and shipments of from 150 to 200 tons of ore are being made monthly. A 550-foot crosscut will probably be run on the Mountain Beauty by Mackin & Co. A station is being cut on the 900-foot level of the Vindicator; pumps will be lowered to that point, and sinking will be continued to the 1200-foot level; sinking is also in progress from the 400-foot station in shaft No. 2. Potvin & Vaine, operating the Christmas, are making good-sized shipments of ore from

that mine. The Victor Leasing Co., operating the north end of the Theresa, is sending out screenings from the 100-foot level running \$50 to the ton; work is started on the 150-foot level. The King & Whiting lease on the Hull City placer recently shipped eighty-two tons of screenings and twenty tons of rock; ore is said to average \$40 to the ton. Spellman, Berry & Co., operating the north end of the Blue Bird, on Bull Hill, are shipping ore that runs two ounces in gold to the ton. A strike of good ore is reported made on the 400-foot level of the Kittle M., operated by the Kittle M. Leasing Co.; ore body is said to be over 3 feet wide, and assays run \$70 the ton. The Porter lease on the main workings of the Lucky Guss, on Bull Hill, is bought by the Stratton Cripple Creek M. & D. Co. Holbrook, Williams & Co., leasing block No. 1 of the Trail, are drifting southeast through a phonolite dyke on the 170-foot level.

The Warren Leasing Co. has suspended operations on the Monument-Dillon, at Victor, temporarily. Sinking of the Kellum shaft on the Anna Belle, on Galena hill, is under way; new plant works satisfactorily; shaft, now a little over 83 feet deep, will be continued to the 110-foot level, where drifting will be started. Ore from the 550-foot level of the Pointer recently returned \$604 to the ton. Winchester & Stevenson, who have leased the Rhinoceros and Nil Desperandum claims of the Gould Co., on Raven hill, are sinking a 1000-foot three-compartment shaft; C. M. Crowder, Supt. The Bonanza Leasing Co., operating the Kentucky Belle, on east slope of Raven hill, is running north and south drifts on the vein in the 125-foot and 200-foot levels.

Ore running over \$100 to the ton is reported in the upraise from the tunnel level of the Galena, on Red mountain, near Cripple Creek. The Mabel M. is shipping ore from the new strike recently made on the 355-foot level. A drift is being run on the vein. The north block of the Little Joe is leased to J. F. Sanger for eighteen months.

IDAHO.

BLAINE COUNTY.

The Hattie 20-stamp mill that will go in at the Golden Star, near Hailey, will cost about \$50,000, and it is expected to be ready for operations by June.

IDAHO COUNTY.

The shaft on the Buffalo Hump M. Co.'s property, at Buffalo, is down over 1600 feet.

LEMHI COUNTY.

At Salmon, the new shaft in the St. Joe, owned by the Franklin syndicate, has struck a vein at 75 feet of massive copper, granite and spathic iron.

SHOSHONE COUNTY.

At Delta the old pay streak on Trail gulch is found above Myrtle by J. Savage and others.

At Delta F. A. Knapp of the Silver Eagle M. Co. is arranging to drive 300 feet more tunnel. The members favor increasing the capital stock \$100,000. The permit system established by Gov. Steunenberg in 1899 is abolished by Gov. Hunt. The output of the mines of the Cœur d'Alenes for 1900 is given as follows:

Bunker Hill.....	\$1,750,000
Standard.....	1,600,000
Morning.....	1,600,000
Frisco.....	1,350,000
Tiger-Poorman.....	1,350,000
Empire State.....	1,250,000
Mammoth.....	1,000,000
Hunter.....	525,000
Hecla.....	500,000
Crown Point and Silver King.....	300,000
Sixteen-to-One.....	150,000
North Side (Gold Belt).....	125,000

Total.....\$11,500,000

The Canyon Creek mines employed a monthly average of 1150 men; Wardner, 700 men; the two Mullan mines, 415 men; North Side gold mines, 50 men. Each man's pay at \$3.50 per day would make their total daily earnings \$8102.50. At least 400 more men are employed in developing new properties situated in the various sections of the district. Total shipments of crude ore and concentrates for the past year are said to be 175,000 tons.

MISSOURI.

JASPER COUNTY.

The Missouri & Kansas Zinc Miners' Association has contracted to ship 50,000 tons of high-grade zinc ore from the Missouri-Kansas zinc mining district to European smelters; it is said that there are 6000 tons of zinc ore now awaiting shipment; first cargo will go out in March.

MONTANA.

DEER LODGE COUNTY.

The Gladstone group, on Gold creek,

about 3 miles west of Pioneer, will be worked by the Gladstone M. Co., recently organized. Work will begin early in the spring, and a mill may be built during the summer.

Beginning Feb. 1st the eight-hour system of work will be put into operation in all the Anaconda properties. With a half hour for lunch, the men who go to work at 8 o'clock in the morning will quit at 4:30 in the afternoon.

FERGUS COUNTY.

A 100-ton per day mill is to go in on the Barnes-King group, in the North Moccasins, near Gilt Edge, this spring. The Great Northern M. & D. Co., Supt. E. W. King, will put in the mill and will develop the group mentioned.

GRANITE COUNTY.

The Dorothy M. Co. of New York is organized to work mines east of Granite. Work will begin early in the spring. A small mill will go in first, but if developments prove successful a larger one will go in.

LEWIS AND CLARKE COUNTY.

The new Sattler zinc smelting plant, which will be built near Helena, will give employment to 500 men.

MADISON COUNTY.

Work on the new dredger of the Conrey Placer M. Co. at Virginia is under way. It will cost nearly \$65,000.

At Pony the Conrey Placer M. Co. will begin work on the new dredger soon; overhauling the Gordon dredger is completed; J. Baier, General Manager.—McKinnon, Drake & Co. are running a tunnel to tap the shaft on the Galena, near Sterling.—Foster Bros. have their timber for the new dredger which they will build at Laurin on the ground, and will go ahead.—In Bridge canyon, C. Campbell is running a crosscut tunnel to tap the lead on the Bonanza.—Pritchett & Eastridge, operating the Keynote, in Georgia gulch, are shipping ore.—Wiseman & Townsend, working the Buckeye No. 2, at Brandon, are taking out ore.

PARK COUNTY.

The Robinson G. M. Co., capital \$1,500,000, is incorporated at Livingston, to work the Revenue and Robinson claims at Jardine; twenty stamps are dropping at the Revenue mill on Revenue ore; men are also working on the Robinson.

SILVER BOW COUNTY.

A great percentage of the gold and silver production of Montana came from the copper ores of Butte—almost two-thirds of the silver and fully one-fourth of the gold. The balance is from smelting ores, mill bullion, cyanide vats and placer mines in other parts of the State.

SILVER BOW COUNTY.

Estimated mineral outputs of the mines at Butte for the year 1900 are given as follows:

Anaconda	\$20,469,706
Boston & Montana	12,783,185
Butte & Boston	3,956,000
Montana Ore Purchasing Co. . .	3,404,000
Parrot Co.	3,341,352
Colorado Co.	3,075,000
W. A. Clark mines	2,472,000
Speculator mine	3,200,000
Washoe Co.	667,932
Other mines	50,000

Total

The Amalgamated Copper Co. has from the Northern Pacific R. R. an option on all the latter's timber lands in the State. The option runs three years and is at the rate of 50 cents per 1000 feet. The Amalgamated mines consume 100,000,000 feet of timber annually. The cost to the Amalgamated Co. will aggregate \$6,000,000.

NEVADA.

STOREY COUNTY.

Repairs are made at the station on the 850-foot level of the Belcher, at Virginia. A chute is going in on the third and fourth floors of the Con. Cal. & Va. at Virginia. The winze in the old north drift is down 33 feet. One of the air compressors is now being driven by a 100 H. P. electric motor.—The west drift on the 56-foot level in the Central tunnel of the Ophir is in 280 feet; face in quartz and porphyry.—The west crosscut on the Central tunnel level of the Mexican is in 273 feet.—At the Sierra Nevada the south drift on the 220-foot level is in 100 feet; face in porphyry and quartz.—A 5 H. P. electric motor is in the main west tunnel of the Chollar; it will run the blower. The main north drift on surface tunnel level is in 450 feet.—At the Potosi the north drift on the 80-foot level is run 210 feet.—Ore is being taken from the first, second and third floors of the 325-foot level of the Gould & Curry.—West crosscut No. 9, on the 425-foot level of the Best & Belcher, is run 143 feet.—At the Utah surface tunnel No. 2 is run 835 feet.

WHITE PINE COUNTY.

Supt. Marx of the Ely M. Co., at Ely,

reports progress at the Chainman. The new mill is expected to be turning out bullion next month.

NEW MEXICO.

COLFAX COUNTY.

The Golden Era, near Elizabethtown, will put on more men at its mill.—The Gold & Copper Deep Tunnel M. & M. Co. in Elizabethtown will put a plant of machinery on the property in the spring.

OHIO.

WYANDOT COUNTY.

During 1900 thirty-three wells were completed in this county, the average daily production being fourteen barrels of oil to the well.

OREGON.

JACKSON COUNTY.

Operations at the Sterling, near Jacksonville, are resumed.—A clean-up of eighteen days' crushing by the 15-stamp mill, operated by the Victor, Jr., Co.'s (Greenback) mine in Grave Creek district, produced \$21,000. About 100 men are employed there.

SOUTH DAKOTA.

CUSTER COUNTY.

C. H. Crabtree, Supt. Gladiator M. Co., recently bonded eleven mining claims near Custer City—the Gold Fish group; men will be put on and work pushed.

LAWRENCE COUNTY.

Twenty stamps are dropping at the Uncle Sam, at Perry.

UTAH.

BOX ELDER COUNTY.

The Henrietta M. Co., capital \$25,000, is incorporated to work the Henrietta group, near Maple Springs.

GRAND COUNTY.

The smelter of the Coconino M. Co., A. Nebeker manager, continues closed down. It has been decided to erect a leaching plant.

IRON COUNTY.

At the Jumbo, Stateline, Supt. Menedue recently opened up ore in the winze running \$62 to the ton.—It is said that the Ophir, at Stateline, will build an assay office.

Sinking is resumed on the Ophir at Stateline. The shaft, now down 300 feet, will go to the 500-foot level, at which depth crosscutting will be begun; F. M. Lathrop, manager.

JUAB COUNTY.

Thirty-six cars ore recently shipped from the Lower Mammoth at Tintic returned \$117.71 net. The returns showed 10.8% copper, 40.4 ounces silver and 80 cents in gold to the ton.—Ore is opened up in crosscuts on the 600-foot level of the Little Chief at Eureka; Supt. J. Oberndorfer.

An upraise is being run on the Yankee Con. at Tintic; Manager R. Guenther.

SALT LAKE COUNTY.

At Bingham connection is made with No. 7 tunnel on the Highland Boy and the tramway is now taking out ore through that channel. Four hundred tons daily will be sent out at present. More will be shipped when the smelter is completed. Supt. of Construction Raht of the American Smelting & Refining Co. expects to have the new \$1,000,000 smelter, now going in in Salt Lake valley, near Salt Lake, in operation this year.

The Rogers mill at Bingham will start.—The Andy tunnel on the Parnall group (Highland Boy Con. Co.'s mines), now in about 300 feet, will be run an additional 200 feet; Supt. Smith.

The new mill on the property of the Butterfly M. Co. at Bingham was started up on the 22nd inst.—The main tunnel in the Alamo at Bingham is again in a body of copper, gold and silver-bearing sulphides; Manager J. T. Hodson.—The Dewey mill at Bingham is running on Northern Light ore.

TOOELE COUNTY.

J. J. Connor, operating the Nebraska group, near Stockton, has ore running \$4 gold and seven ounces silver to the ton at a depth of 75 feet.—The shaft on the West Argent, down 640 feet, will be sunk to the 700-foot level.—Work is in progress on the Honerine and Hercules mines, near Stockton.—The Ophir at Ophir is still shipping ore. Heretofore the mine and mill have shut down with the advent of winter, but operations at both are now in full swing. Seventy tons of concentrates are turned out daily. It is reported that the mill will be enlarged to double its present capacity.

WASHINGTON.

FERRY COUNTY.

The Keystone G. M. Co., capital \$50,000, is incorporated at Republic to work the Oversight and Ruby Fraction claims, near there.

OKANOGAN COUNTY.

The Okanogan Free G. M. Co., operat-

ing on the Similkameen river, in Palmer mountain district, near Loomis, has a 10-stamp mill on its property.

FOREIGN.

BRITISH COLUMBIA.

The iron mines of Texada island, owned by the Puget Sound Iron Works, have been transferred under lease to the Pittsburgh Iron Works on a royalty basis.

The Sullivan group, near Kimberley, in East Kootenay district, has contracted with the Canadian Pacific R. R. Co., operating the Trail smelter, to ship its output during 1901 to the latter; shipments are being made; a spur from the siding at Kimberley to the mines will be built; Supt. C. H. Wolf.

The Kaslo Smelter, Ltd., is formed in Kaslo, to build a smelter and treat the wet ores of the Kootenays; capital stock, \$600,000.—The shaft on the B. C., in Summit Camp, is down below the 400-foot level. One hundred and five men are working. Work on the Yellowstone, in Skylark Camp, is resumed.—Sixty-five men are now working on the properties of the Dominion Copper Co. at Phoenix.

During 1900 the St. Eugene at Moyie shipped 17,000 tons of ore, valued at \$1,000,000. The payroll averaged \$30,000 per month. The 400-ton per day concentrator is running steadily and regular shipments of concentrates to smelters in the United States and Chile are being made. Two hundred and seventy men are employed.

The Velvet, near Red Mountain, in the Trail Creek division, is shipping ore; the Great Northern Ry. Co. will probably build a line from Red Mountain to the Velvet.—The Giant, at Rossland, is shut down temporarily.—During week ending Jan. 19th the shipments of ore from the mines at Rossland were as follows:

	Tons.
Le Roi	2,683
Centre Star	2,160
War Eagle	630
Iron Mask	180
Le Roi No. 2	180
Giant	60
I. X. L.	23
Total	5,916

An 18-drill compressor is going in on the Velvet.—The new hoist at the Le Roi is about completed and sinking of shaft will probably be resumed soon; work on the foundations for a second hoist is progressing.—The shaft on the Rossland Great Western is down 720 feet.

During the past year the North Star, at Fort Steele, has paid three dividends, aggregating 12% of the capital stock.

The Sullivan produces about sixty tons of ore per day.—The Crow's Nest Coal Co. is taking out about 1300 tons of ore daily.—The mineral production of the mines of Southeast Kootenay for 1900 is estimated to be \$2,384,534.

Since November, 1899, returns from ore crushed at the Granite mines at Ymir are given as \$70,500. The bottom level is driven 540 feet on the vein. An incline shaft will be sunk on the vein to a depth of 300 feet, levels being run at 100, 200 and 300 feet. Twenty stamps will probably be added to the twenty now in use.—Senator Clark of Montana is reported to have made the first payment in the purchase of the big copper property on Howe sound, 18 miles from Vancouver, known as the Britannia claims, on which little development has been done. The price to be paid is \$1,000,000.

MEXICO.

The Indianapolis-Sonora C. M. Co. will work on a large scale its properties in the Cananea mountains, Sonora.

The Mulatos G. M. Co., operating at Mulatos in the Sahuaripa district, Sonora, will soon put in six additional Bryan mills; its plant now consists of a battery of stamps, two Bryan mills, four concentrating tables and a twenty-five ton cyanide plant. Should development now going on prove satisfactory, a 250-ton cyanide plant will be built. At present ore is carried on mule-back to Torres, 125 miles, and from there hauled to Soyapa, 100 miles farther.

The Motezuma Copper Co., operating reduction works at Placeritas, in Motezuma district, Sonora, employs about 1000 men.—A railroad now being built to Placeritas is expected to be completed within a year.—Ores from the Pilares de Teras mines, in same district, are shipped to El Paso, Texas.—M. Harper is operating the Dos Cabezas and Monument mines, 20 miles east of Bacerac.—The El Carmen, 20 miles east of Oposura, and owned by D. B. Durazo, is producing high-grade silver ores, which are profitably worked by arrastra and the primitive type of smelter in use over a hundred years ago.—T. H. Boaz of Corralitos has renounced the old Gabilan, near Tepachi, has sunk a shaft 80 feet and has drifted at that depth.—The Sonora De-

velopment Co. will begin work on its properties at Placeritas, Tepachi and Oposura.

NOVA SCOTIA.

The Colonial Co., operating at Renfrew, in a recent run of 110 tons, produced a return selling for \$54,000. There are about thirty mines in the Province that are regular producers and whose ore is milling about \$9 per ton on the plates, besides producing some good concentrates.

THE KLONDIKE.

Men are engaged in quartz mining. Ore from four Bonanza creek groups assays \$40 per ton gold.

Personal.

H. MOORE of Cripple Creek, Colo., is in Tintic, Utah.

F. CARRIGAN is foreman Blue Bell, Big Bug district, Prescott, Ariz.

J. S. MURPHY is appointed Supt. Colorado King, Cripple Creek, Colo.

A. W. HAVENS has returned to San Francisco from Virginia, Nevada.

A. W. MOUNTNEY is receiver for the Fortune M. & M. Co., Bingham, Utah.

GEN. J. M. GLEAVES has returned to San Francisco from Washington, D. C.

C. A. WACK is Asst. Supt. Treadwell & Mexican M. Co., Douglas island, Alaska.

H. J. BURTWELL, late of Inyo county, Cal., has taken residence in San Francisco.

THOS. G. HURLEY has been re-elected vice-president The Exploration Co. of New York.

W. S. HASKIN of British Columbia succeeds W. Sellkirk of the Iron Mountain at Keswick, Cal.

N. S. BERRY may succeed E. H. Cook as Supt. United Globe mines, Globe, Ariz., who lately resigned.

A. W. WARWICK, formerly of Danby, Cal., is now in charge of metallurgical matters at Leadville, Colo.

A. F. HOLDEN, managing director U. S. M. Co., Bingham, Utah, will arrive there from Europe March 1st.

C. L. MILLER, formerly Supt. Kate Hayes, Grass Valley, Cal., goes to the Klondike to superintend a mine there.

FOREMAN HUNTER AND MASTER MECHANIC BELL of the Treadwell mines, on Douglas island, Alaska, have resigned.

G. T. COFFEY of the San Juan Ridge, near Nevada City, Cal., goes to the Klondike to assume charge of a mine there.

J. NOONAN, Supt. Dos Cabezas Con. M. Co., Arizona, has resigned and is now in California. C. M. Roberts succeeds him.

PERCY R. STUART of the California Wire Works has returned to San Francisco from a business trip through Utah.

A. MELDRUM, manager Meldrum tunnel, between Ironton and Telluride, Colo., is at the latter place from Glasgow, Scotland.

FELIX CHAPPELLET JR. goes from Placer county, Cal., to superintend operations at the Santa Rosalia mine, Sonora, Mexico.

A. RAHT, Supt. of construction of the American Smelting & Refining Co., has returned to Salt Lake, Utah, from Mexico.

R. WINTERS, Supt. dredger, Idaho City, Idaho, has returned there from Boston, Mass.

C. D. MARX, professor of engineering at Stanford, Cal., University, is elected president of the Technical Society of the Pacific Coast.

W. F. ARAM has returned from Alameda, Cal., to the Magnet mine, which he is superintending at Gold, Madera county, Cal.

E. M. GRANT, head electrician of the Mountain Copper Co., Keswick, Cal., has resigned. J. Mackenzie of Portland, Or., succeeds him.

VICE-PRES. BARNEY and stockholders Sisson and Turmmans of the Troy Copper Co., of Troy, Ariz., have returned there from New York.

D. H. LAWRENCE, formerly Supt. Waldo C. S. Co., Waldo district, Oregon, is appointed Asst. Supt. of a London mining company at Sonora, Mexico.

W. W. THURSTON, Supt. Omaha Con., Lone Jack and Homeward Bound mines of Grass Valley, Cal., contemplates immediate departure for South Africa.

GEORGE P. LOW succeeds Dr. F. A. C. Perrine as local honorary secretary for the Pacific coast members of the American Institute of Electrical Engineers.

H. T. SCOTT has been re-elected president and treasurer Union Iron Works, San Francisco; Irving M. Scott, vice-president and general manager; J. O'B. Gunn, secretary; G. W. Dickie, manager.

Books Received.

"Engineering Chemistry," second edition, revised, 8vo., pp. 500, 132 illustrations; Thos. B. Stillman: A work worthy of commendation as of value to the analytical chemist, the chemical engineer, the metallurgist or mine manager; not too technical for daily use and sufficiently exact for the most delicate tests; a sort of connecting link between the college professor and the mine superintendent. The formulae for determination of certain metals, the chapter on boiler scale, that on alloys and one on energy equivalents are particularly useful. Price \$1.50. The Chemical Publishing Co., Easton, Pa.

"The Coal and Metal Miners' Pocket-book," sixth edition, enlarged and practically rewritten, 12mo., pp. 637; illustrated; morocco; thin, tough paper; got up in about the same general way as the Kent or Haswell vade mecum; a wealth of matter of interest and value to mining engineers and superintendents, and well arranged. The chapters relating to coal mining contain much that is up-to-date; the glossary is unusually extended, containing nearly 2500 mining terms, and the whole is so indexed as to make its contents readily accessible. Price \$3. The Colliery Engineer Co., Scranton, Pa.

"Modern Ore Concentration and Mill Practice": This is a little treatise issued by the Colorado Iron Works Co., Denver, Colo., so full of sensible statement and information, the result of experience, as to justify notice in this column. Among other things, it says what this paper has so persistently maintained, viz: that "concentration is a fine art, and needs as much skill as the business of smelting and refining ores." Incidentally, the Denver concern advertises its special make of concentrator. Anyone at all interested in concentration will find matter of interest in the booklet, which will be sent free of charge anywhere on application to the Colorado Iron Works Co., Denver, Colo.

Equally deserving of similar notice is the 1901 edition of the Risdon Iron Works' treatise on "Gold Dredging Machinery." This is the fourth edition of this little work. It contains data concerning costs of operating gold dredgers from actual working experience therewith, abundantly

illustrated; issued by the Risdon Iron Works Co., San Francisco, Cal.

"The Copper Handbook," 8vo., pp. 328, a compendium of historical, statistical and descriptive information regarding Lake Superior copper companies; price, \$1; compiled and published by H. J. Stevens, Houghton, Mich.

Obituary.

ELISHA GRAY, by many considered to have been the real inventor of the telephone, died suddenly at Newtonville, Mass., on the 21st inst. He was foremost among electricians and inventors, and will live in history as one of the men of the nineteenth century who aided greatly in the world's advancement.

Commercial Paragraphs.

THE New York office of the Viennot Advertising Agency has been moved from 127 Duane St. to Room 719, Temple Court Building, Nassau St.

W. H. STROUT & SON have purchased the assay and laboratory equipment of F. M. Benedict in Cripple Creek, Colo., and have taken possession, discontinuing their Denver office.

THE Jeaneville Iron Works Co. have a contract with the Montana Ore Purchasing Co., Butte, Mont., for three compound condensing mine pumps, with condensers, and with the Butte & Boston Con. Co. for one triple expansion pump, capacity 1,000,000 tons per day, 1400 feet lift, also one for 600 feet lift.

NOCK & GARSIDE, Denver, Colo., manufacturers of special types of elevators for buildings, recently put in some of their equipment at the shop of the Gardner drill, Denver; the Chicago Pneumatic Tool Co.'s Denver shops; the Rocky Mountain smelter, and the Union Gold Extraction Co. at Florence, Colo.

THE Wetherell magnetic separator has been in use for several months at the ore testing works of Henry E. Wood, Denver, Colo., during which numerous tests have been made on Leadville zinc ores. It is reported very effective work has been done in the way of separating the zinc from the pyritic and oxidized iron prod-

uct. Mr. Wood's plant is equipped for practically all metallurgical and mechanical tests and within the past year he has received ores from nearly all parts of the world.

A FIRM conveniently located to northern California mining districts, and prepared to handle any class of electrical repairs on short notice, is the Electrical Construction Co. of Sacramento, of which O. A. Hoyt is manager. They are agents for the Wagner Electric Manufacturing Co. of St. Louis, Mo., and have facilities for installing generating plants and power plants, telephone lines, etc. Mr. Hoyt is also principal of the Sacramento manual training school of mechanical and electrical engineering, and would be pleased to answer any inquiries in regard to the business or to send a prospectus of the school.

Recently Declared Mining Dividends.

	Payable.
Gold Coin M. Co., Colo., 3 cents per share, \$30,000.....	Jan. 15
Boston & Montana M. Co., Mont., regular \$5 per share, extra \$5 per share, \$1,500,000.....	Jan. 25
Con. G. M. Co., Colorado, 1 cent per share, \$10,000.....	Jan. 25
Bull Hill Con. M. Co., Colorado, 1 cent per share, \$15,000.....	Jan. 25
Modoc M. Co., Colorado, 1 cent per share, \$5000.....	Jan. 15
Standard Con. M. Co., California, 10 cents per share, \$20,000.....	Jan. 26

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SLIDABLE AND SWINGING WINDOW SASHES.—No. 666,053. January 15, 1901. Bernard Hausmann, San Francisco, Cal. This invention relates to a mechanism for sliding window sashes and means for disengaging such sashes from suspending cords on one side, so that they are turnable about hinges on the other side to swing inwardly for the purpose of obtain-

ing access to the outside of the sash and for other reasons. It consists in a novel construction of the hinges, the slidable parts in connection with which the sash moves up and down, a means for holding the sash in place when disengaged from the cord of the opposite counterbalance weight, and a means for attaching and securing said cord so as to hold it, and weights attached thereto in place while the sash opens about its hinges.

BALL CASTER.—No. 666,009. January 15, 1901. M. C. Hall, Bakersfield, Cal. The object of this invention is to provide a caster for furniture and like articles. It consists of a large ball adapted to form contact with the floor or other surface, this ball being contained in an exterior casing, within which are smaller balls which form a bearing for the larger one. These sets of small balls are turnable upon bearing rings or surfaces, and thus allow the main large ball to revolve freely in any direction.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING JAN. 15, 1901.

666,002.—CONCENTRATING TABLE—W. G. Dodd, S. F.	19

Latest Market Reports.

SAN FRANCISCO, Jan. 24, 1901.

SILVER—Per oz., Troy: London, 28½d (standard ounce, 925 fine); New York, bar silver, 62c (1000 fine); San Francisco, 62c; Mexican dollars, 50c.

COPPER—New York: Lake, 1 to 3 casks, \$17.00 cash; carload lots, 16.75; Electrolytic, 1 to 3 casks, 16.75; carload lots, 16.50; Casting, 1 to 3 casks, 16.50; carload lots, 16.37½. San Francisco: 18. Mill copper plates, 20c; bars, 22½c.

LEAD—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.20; Missouri lead, \$4.32½ desilverized lead; San Francisco \$5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6½, sheet 7½, bar 6c; pig, \$4.70 @5.10. London, £16 is 3d per ton.

SPELTER—New York, \$4.15; St. Louis, \$3.95; London, £19 per ton; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY—New York, Cookson's, 10c; Hallett's, 9½c; San Francisco, 100-lb lots, 12c; 300 to 500 lbs., 13½c; 100-lb lots, 15½c.

IRON—Pittsburg, Bessemer pig, \$13.40; gray forge, \$13.50; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL—Bessemer billets, Pittsburg, \$19.75; open hearth billets, \$21.00; San Francisco, bar, 7c to 12c per lb.

TIN—New York, pig, \$27.00; San Francisco, ton lots, 29c; 1000 lbs., 29½c; 500 lbs., 29½c; less, 30c; bar tin, 30c.

QUICKSILVER—New York, \$52.00; London, £9 2s 6d; San Francisco, local, \$48.50 per flask of 76½ lbs.; Export, \$45.

NICKEL—New York, 50¢@60¢; San Francisco, 50¢.

MAGNESIUM—New York, \$3.00 per lb.; San Francisco, \$4.00.

ZINC—San Francisco, 5½c; slab, 5½c; bar, 7c.

BABBITT METAL—San Francisco, No. 1, 10c.

SOLDER—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 15½c.

ASSAY LITHARGE—San Francisco, 10c per lb, small lots.

BISMUTH—New York, 30¢, \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 50-lb lots.

PLATINUM—San Francisco, crude, \$17 ½ oz.; New York, \$18.20 per Troy oz.

ALUMINUM—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

FERRO-MANGANESE—Pittsburg, 80%, domestic, \$62.50, large lots.

PHOSPHORUS—F. o. b. New York 50¢@60¢ per lb.

POWDER—F. o. b. San Francisco: No 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1½, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

CHEMICALS—Cyanide of potassium, 98%—99%, jobbing, 32½¢@33½¢ per lb.; carloads, 30¢@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66½¢ B, 2c per lb.; soda ash, \$1.60 per 100 lbs. 58%; hyposulphite of soda, 2½¢@3c per lb.; blue vitriol, 5½¢@6c per lb.; borax, concentrated, 7½¢@8c per lb.; chlorate of potash, 12¢@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2½¢@2½c; California refined, 1½¢@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3¢@4c per lb.; Cal. s. soda, bibs., \$1.00; sks, 95c per 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

TUNGSTEN—New York, 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN—New York, 37%, 32c; San Francisco, 65c (60%).

Special Meeting of Stockholders.

Notice is hereby given that a special meeting of the stockholders of the RUBY GOLD GRAVEL MINING COMPANY will be held at the principal office of the Company, Room 24, 340 Sansome St., in the city of San Francisco, Cal., on TUESDAY, the 29th day of January, 1901, at 2 o'clock P. M., for the purpose of electing a Board of Directors and the transaction of such other business as may come before the meeting. JOSEPH H. MOOSER, Secretary Ruby Gold Gravel Mining Company, 330 Sansome St., Room 24, San Francisco, Cal.

BRITISH COLUMBIA MINES

Gold, Silver-Lead and Copper Properties. Excellent chance for profitable investments in legitimate mining in BRITISH COLUMBIA. Capital needed for developing promising prospects. A specialty made of FREE MILLING GOLD properties. Very promising FREE MILLING GOLD properties for sale; terms reasonable. Mines examined and reported on by reliable mining engineers. Correspondence solicited. Address Andrew F. Rosenberger, P. O. Box 700, Nelson, B. C.

SITUATIONS WANTED.

Experienced licensed land and mine surveyor, competent at assaying and report work, bookkeeping and photography, wishes a position for three months or less. Partial outfit. References exchanged. H. W. H. Penniman, Santa Cruz, Cal.

POSITION AS MILL MAN OR VANNER MAN. Capable of taking charge of mill. Can give good references. Address J. H., 40 Pond Street, San Francisco, Cal.

ELECTRICIAN.

familiar with the repairing of electric mining machinery, desires position anywhere in California. Spanish, German and English. Address A. D., care of Mining and Scientific Press.

WANTED—A position as superintendent for a mining company by a man of 16 years' practical mining experience; understands mining and milling (amalgamation, concentration and leaching); good assayer and accountant; would accept a subordinate position if good; references. Address "Advertiser," 1225 Webster St., Oakland, Cal.

A position as superintendent or mining foreman by a man of 20 years' practical experience in mining in all the branches of the industry in California and Mexico—gold, silver, copper and quicksilver mines. Have had the handling of large forces of men. Can speak Spanish. Can go through and secure any kind of ground. The best of references. D. E. F., care this office.

A sober, industrious young man, who is a competent assayer, surveyor, draughtsman and bookkeeper, wishes a situation. Has had eighteen months' practical experience and two years' technical training. Is willing to make himself generally useful about a mine. Salary reasonable; opportunity to show ability considered first. References. Address R. M., Mining and Scientific Press.

Experienced Metallurgist and Chemist of high standing, with first-class references, is open for immediate engagement as superintendent of a lead smelting or cyanide or chlorination plant, preferably located in California, Arizona, or Montana. Would be willing to accept moderate salary with small interest in plant or lease same. Address M. J. E., 1022 South 14th Street, Denver, Colorado.

CHEMIST AND ASSAYER, with experience in draughting, bookkeeping and typewriting, desires position as assayer or assayer and bookkeeper in mine or as secretary to mining engineer or mine official. Has fair literary and scientific education. Experience in the preparation of reports, prospectuses and catalogues. Excellent moral character and good health. For further particulars, address E. K. M., care Mining and Scientific Press.

Situation Wanted by Mining Engineer of 20 years' experience in California, Colorado, Mexico and Germany. Has had charge of large properties of gold, silver, lead, copper, sulphur and oil. College graduate; good assayer, surveyor and accountant; speaks Spanish. Has experience in railroad construction and road building. Formerly U. S. deputy mineral surveyor and member of geological field force. Will go anywhere. Address P. M., Mining and Scientific Press.

Mining Accountant and Store Manager.

A young man of energy and ability, and thoroughly experienced in all details of mine accounting, store managing, buying, contracting, etc. Is desirous of obtaining an opening. Is fully qualified to assume full charge of such work or to render general assistance. Highest references will be furnished and satisfactory services guaranteed. Address B. F. O., this office.

WANTED.

MINE PROMOTER WANTED

To influence capital in A1 developed gold mine near Buffalo Hump, Idaho. Address Mineral Recorder, Elk City, Idaho.

WANTED.

A Second-Hand Automatic Cut-Off Engine. 40 H. P. OR 45 H. P. IN GOOD ORDER. Address MINING CO., Box 10, care of this office.

WANTED.

Assayer, Chemist and Surveyor, with Surveying Instruments.

Must furnish good references as to character and ability and from previous positions. Give age; experience. Single man preferred. Steady work. Wages \$75 per month and board.

Address A. C. S., Box 512, Prescott, Arizona.

SPECIAL NOTICE.

Capitalists and wealthy syndicates desiring to purchase large operating gold and copper mines, at owners' bedrock prices, can most likely find what they want by corresponding directly with the undersigned. By so doing buyer and seller can be brought together without the intervention of useless and undesirable promoters, brokers and middlemen. E. J. FRASER, 522-523 Parrott Building, San Francisco, Cal.

BENJAMIN T. LLOYD, STOCKS, BONDS AND MINES.

Have immediate customers for well-developed Gold and Copper Properties. P. O. Box 608, SALT LAKE CITY, UTAH.

To Mine Seekers.

ONE-THIRD (POSSIBLY HALF) INTEREST in four gold quartz claims in Idaho for \$1000; money to be used in developing; croppings strong and 1500 feet in length; over 50 feet wide. JOHN H. T. L., Etna, Siskiyou County, Cal. (Advance Office.)

Big Vein Cyaniding Ore IN MONTANA.

Over 12 feet wide; values \$5 to \$30, gold and silver. Mine can be developed cheaply by tunnels to depth of 600 feet. Many improvements; 1500 feet work done; buildings up, and good road; timber and water. Prospect for a big mine seldom equaled. Lease and bond on favorable terms. D. S. M., care this office.

FOR SALE.

FOR SALE.

Developed Silver-Lead Mines and Prospects, Parral and Santa Barbara Districts of Mexico. The coming greatest camp in the Republic. Correspondence solicited.

H. E. RUNKLE, El Paso, Texas.

COMPRESSOR AND HOISTS FOR SALE.

1 4-drill Norwalk steam compressor, compound air cylinders.
1 6"x8" double engine, single reel hoist.
1 8"x10" double engine, double reel hoist.
1 double reel water or steam hoist.

Machinery all practically new. Convenient for inspection. Address "BARGAIN," P. O. Box P, Auburn, Cal.

GUARANTEED MINING STOCK FOR SALE.

Excellent chance for profit, no chance for loss. Can convince the most skeptical that our way of guaranteeing mining stock is perfectly safe and one of the most desirable investments. Can furnish highest grade of references. Write or call for particulars. If you wish to purchase, on E. N. BREITUNG, Marquette, Mich., or branch office, Washington, D. C.

NOTICE OF AMENDMENT OF ARTICLES OF INCORPORATION.

Notice is hereby given that it is the intention of the JAMISON MINING COMPANY to amend its Articles of Incorporation by substituting for the second of said articles setting forth the purposes of the Corporation, which now reads:

"2nd. That the purposes for which it is formed are: The acquisition of quartz mines and gravel mines in the State of California, and to work the same for gold and silver; also, to acquire, hold and use water and water-rights and privileges in connection with such mining; also, to acquire, hold and use timber lands in connection with such mining," the following:

Second.—That the purposes for which it is formed are: To mine for, and mill and reduce ores of all kinds; to acquire by location, purchase or otherwise, to own, hold, work and operate mines in and throughout the State of California; to acquire by purchase or otherwise, to own, hold, develop, improve, lease, let, mortgage, grant, bargain, sell and convey mines, and mining claims and properties in the State of California; to acquire, by purchase or otherwise, to build, erect, construct, own, operate, lease, let, mortgage, grant, bargain, sell and convey mills, and other reduction and smelting works, for the milling and reduction and smelting of ores, and to deal in precious metals and minerals and the products of mines of every kind, and to transport and provide ways and means to transport the same to market, and to market and sell the same; to acquire, by purchase or otherwise, to improve, develop, own, hold, use, lease, let, mortgage, grant, bargain, sell and convey real property, lands, water, water rights, privileges, and franchises of every kind, in and throughout the State of California; to buy, own, hold, sell and generally deal in goods, wares and merchandise, and all kinds of personal property, including the stocks of other corporations, also bonds, notes and personal securities of every kind. To establish and maintain agencies of said Corporation, and to appoint and employ agents, wherever it may be deemed best by said Company; and generally to do any and everything necessary, proper or expedient to carry out the aforesaid purposes and carry on the business of said Corporation.

NOTICE OF STOCKHOLDERS' MEETING.

A Special Meeting of the Stockholders of the JAMISON MINING COMPANY for the purpose of considering and acting upon the matter of Amending its Articles of Incorporation, as above provided, will be held at the office of the company, room 54, 120 Sutter street, San Francisco, California, at two o'clock P. M. on Monday, the 11th day of February, 1901.

By order of the Board at its meeting of December 31st, 1900. S. M. W. CHEYNEY, Secretary Jamison Mining Company.

FOR

SALE.

Six FIVE FOOT Huntington Mills TOGETHER WITH NECESSARY CRUSHING AND POWER PLANT.

Will Be Sold as Separate Items or Entire Mill.

PRESENT LOCATION: NEAR DEADWOOD, SOUTH DAKOTA.

Used Less Than Three Months. Guaranteed in Splendid Condition.

WILL NAME PRICES F. O. B. DEADWOOD, CHICAGO, OR DELIVERED AS DESIRED.

SPECIFICATIONS (Condensed).

- 6 ORE GATES, 24 x 38, rack, hand wheel, frames, bolts, complete.
- 2 ORE BINS, all necessary bolts, rods, nuts and washers.
- 2 GRIZZLEYS, 4' x 10', 1" openings.
- 6 CHALLENGE AUTOMATIC ORE FEEDERS, including hoppers, wood frame, shafts and pulleys.
- 6 HUNTINGTON CENTRIFUGAL ROLLER MILLS, 5' diameter, all fixtures and fittings, complete with wooden frame, shafts, pulleys and gearing.
- 6 COPPER TABLES, 6' x 12', 1/2" copper, electroplated 1 oz. of silver per square foot.
- 2 AMALGAM SAFES.
- 1 BELT TIGHTENER, complete with pulley, boxes, etc., for main belt.
- 1 BELT TIGHTENER, complete with pulley, boxes, etc., for crusher.
- 1 CORLISS ENGINE, built by Fraser & Chalmers, cylinder 20" diameter by 48" stroke, complete in every particular, shaft 10" in diameter, band flywheel 16' diameter, 30" face; weight, 42,000 pounds.
- 3 HORIZONTAL TUBULAR BOILERS, 54" diameter, 16' long, complete with steam drums 30" x 72", mud drums 18" x 66" for each boiler, breechings, smoke box, stack 48" diameter 60' long, all necessary guy rope, half arch fronts, grate bars, cast and wrought iron parts necessary for setting, feed, blow off check and safety valves, gauges and all fittings. Weight, 51,000 lbs. At present these boilers are arranged for setting in one battery. We will make any changes required, furnishing stacks and other items necessary to set each boiler separately.
- 1 HEATER, tubular, 30" diameter, complete, with exhaust pipe.
- 2 NO. 5 KNOWLES BOILER FEED PUMPS.
- 1 BERRYMAN HEATER, 18" diameter by 7' long, copper tubes, 4" pipe inlet and outlet.
- 1 HOOKER VERTICAL SINKING PUMP, 14x8x14, 6" suction 5" discharge.
- 8 ORE CARS, one ton capacity each.
- 1 WATER WHEEL, 50 H. P.
- 1 16" BULLION FURNACE, complete, including 10" Gold Retort, stack and all iron work.
- 1 NO. 5 STYLE B GATES FINE CRUSHER.
- 1 LOT REPAIR PARTS FOR HUNTINGTON MILLS, including roller shells, ring dies, scraper bars, shoes, screens, clamping plates, all new, never used.
- 1 LARGE LOT OF PIPE AND FITTINGS.
- 1 LOT BOLTS, WASHERS, RIVETS AND NUTS.
- 1 LOT OF MISCELLANEOUS SHAFTING, PULLEYS, PILLOW BLOCKS, HANGERS, ETC.
- 120' RUBBER BELTING, 28", 6-ply.
- 58' RUBBER BELTING, 18", 4-ply.
- 150' RUBBER BELTING, 16", 4-ply.
- 70' RUBBER BELTING, 14", 4-ply.
- 2 LOCOMOTIVES, 20" gauge, built by H. K. Porter Co., Pittsburgh, one 6x10 cylinders, the other 8x14 cylinders, both saddle tank.

THE "PELATAN-CLERICI" PROCESS

OF TREATING REFRACTORY ORES

General
Arrangement
of
Pelatan-Clerici
Plant.

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

SAN FRANCISCO, CAL.
AGENTS.

The JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY
: : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS
THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

THE COLORADO IRON WORKS COMPANY,

ENGINEERS AND MANUFACTURERS OF

Smelting Furnaces and Equipments.

The illustration in this advertisement shows one form of our COPPER MATTING FURNACE, employing hot blast; the air being first treated in proper appliance, is conducted through the cast iron bustle pipes placed along the inside of the caisson plates, through the cast iron adjustable tuyeres. This furnace can also be used for silver as well as copper smelting, by changing lining in crucibles. We build them in any size required.

Cold blast may be used if preferred.

The furnace is equipped with our special cast iron jackets, and our patented system of water-jacketed mantles.

Send for our catalogue, showing many different styles of smelters for the treatment of

GOLD, SILVER, LEAD, COPPER AND NICKEL ORES,

also the latest and best method for the economical use of jacket water (a saving of 80% to 90% guaranteed) by our patented

WATER VAPORIZING ATTACHMENT.

We design, manufacture and erect Mills for Concentration and Amalgamation, Milling, Chlorination and Cyanide Processes. In writing for information, give us the analysis or character of the ore to be treated, to enable us to intelligently arrive at the proper method.

DENVER, COLO., U. S. A.

THE GRIFFIN THREE ROLLER ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

CROWN GOLD MILLING CO.

To MINERS and MILLMEN.

If your ores are refractory; if you are losing concentratable values in your tailings; if your mines are in an arid district, or so situated as to make the introduction of water ruinously expensive; if you have large bodies of concentratable ores which could not be profitably treated hitherto,

THEN READ WHAT FOLLOWS:

The CROWN GOLD MILLING COMPANY'S concentrating machinery will concentrate any ores, sands or earths carrying metallic particles or metallic combinations of concentratable dimensions.

A shipping product of unexcelled purity is given, the greatest amount of concentratable values extracted, and a greater tonnage of ore is put into a ton of concentrates than by any other system of mechanical treatment. Every pound of ore delivered to machines is accounted for in the ore and concentrate bins.

It will cost you nothing to investigate, and may mean an increased profit on your ores, or a profit on bodies of ores which heretofore have failed to pay more than cost of treatment; or you may be enabled to make a productive property of a mine now idle.

We have a twenty-ton capacity plant in operation. All are invited to call and test it: from 1000 to 2000 pounds ore will be treated as a test. Charge \$20, to cover cost assays. Results at mine guaranteed to equal results obtained in testing. Wear and tear and labor cost guaranteed not to exceed cost by wet treatment of same character of ores.

Our machines are not for sale: they are placed on lease or royalty charge as may be agreed upon, and if results are not obtained as guaranteed no one loses but ourselves. Practice is better than theory: direct evidence is better than hearsay. All we ask of you is to come and be convinced that we have claimed less than we accomplish.

GATES FINE CRUSHER.

The result of ten years' solid work, Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H. Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

A Dry Pulverizer

FOR ORES, CEMENT and
HARD SUBSTANCES.

Equals a 50-ton stamp mill. Grinds to any mesh under 8.
No siltiness, no choking. Takes any fineness of feed under 1 in.
No special foundation. No quartered belts. No internal screens. Outside separation gives 100 per cent product most uniform and granular.
No oil in product. No stoppages for oiling or adjusting.
Can be used wet. Can be moved on a truck.
Guaranteed for one year. Free new for worn out parts.
Little wear, no duplicate parts, no break-downs.
Cost 1/4 to 1-10 of any installation of same capacity.
Takes only one-half the horse power. Is automatic.

For Particulars and Catalogue

KENT MILL CO., 5 Beckman St., NEW YORK.

THE SNODGRASS COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the most successful machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the Cement or Clay, and saves the Gold although it is as fine as flour. It is only necessary to have from 4 to 6 miner's inches of water to work 150 tons or more every twenty-four hours. The machinery consists of two iron troughs or "concaves," each 26" in diameter, one of which is about 18' and the other 12' long. In these troughs are strong revolving shafts with projecting teeth, made of White Iron, 2 3/4" wide by 1 1/2" thick, placed in spiral form around the shaft about 2" apart, forming a conveyor. The first shaft is geared to make from 150 to 250 revolutions per minute, and the second one from 300 to 500. There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly. There is a space of about 4" in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is free it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made. In many cases the 18' machine alone is needed, as the two are only used where we have hard Cement or Clay to work. It requires from 10 to 12 H. P. to run the complete machine, and from 6 to 8 H. P. for the 18' one alone. I also manufacture a 6' machine about one-half the diameter of the others, and lighter in proportion, to be run by hand power, with small amount of water, and capacity of about two tons per hour. This can be easily moved from place to place.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cid., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says.
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, silty or rebellious ores. Zinc and lead combinations handled in good shape

Operator taking courses or horizontal angles with BRUNTON'S PAT. POCKET-MINE TRANSIT.
 If you wished to find the angle between two points below the horizontal with a sighting compass or an ordinary transit, you would first have to set up your tripod or staff and then level up your instrument. All this takes time. If you only wanted to get the angle within a degree or so, you could take a BRUNTON TRANSIT, and holding it in the position shown, take your readings in less time than you can place any other instrument. Send for descriptive catalogue B to
 F. W. Braun & Co., Los Angeles, Cal., Agents for balances and the Brunton Patent Pocket Transit.

No. 044, BUTTON BALANCE. Sensitivity 1-100 milligramme. If you are in the market for the very best balance obtainable at a moderate price, write us for particulars about the No. 044. You will be surprised to find how cheaply it can be purchased for cash. While we cannot recommend this balance for fine gold work, a great many assayers are using it for such successfully. Send for illustrated catalogue A, for complete description and prices, to

THE Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,
Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested by our own and our customers' experience during the past twenty years. They are being used by more than nine-tenths of the prominent American engine builders, who are good judges of lubricators. Many of these have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use, or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our new catalogue, showing our full line, will be sent on application.

ASSESSMENT NOTICES.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of December, 1900, an assessment (No. 20) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 2nd day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

EUREKA CONSOLIDATED DEFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of December, 1900, an assessment (No. 28) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of January, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 6th day of February, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, 214 Pine street, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 28) has been postponed to TUESDAY, the 26th day of January, 1901, and the day of sale from the 6th day of February, 1901, to TUESDAY, the 12th day of February, 1901.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

TANANA MINING COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of December, A. D. 1900, an assessment (No. 2) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, Edward H. Stearns, at his office, Room 801 Claus Spreckels Building, Cor. Third and Market Sts., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of February, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 6th day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.

Office—Room 801 Claus Spreckels Building, Cor. Third and Market Sts., San Francisco, California.

YUBA RIVER GOLD DREDGING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Smartsville, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of January, 1901, an assessment (No. 2) of three cents (3 cents) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 214 Pine street, Room 23, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALBERT CERF, Secretary.

Office—No. 214 Pine street, Room 23, San Francisco, California.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of January, 1901, an assessment (No. 9) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of February, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 18th day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

N. F. REMINGTON, Secretary.

Office—112 Main street, San Francisco, California.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully,

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

ROBT. WALKER, Superintendent.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours,

ROANOKE MINING COMPANY,

MOSELUMNE HILL, March 4, 1897.

A Constant Magnitude.

The problem of time is one which touches all branches of science, and is unsolvable. Time has been regarded as objective; it has been also considered, like space, to be subjective. It is the most general natural law, affecting and affected by all the conditions of human existence. Strictly speaking, there is no such thing as time "past" or "future": there is but one eternal now. But as history is fable agreed upon, so for convenience what we call "Time" is arbitrarily divided. Analyzing our conception of time, one finds in it four elements: First, continuity. Time moves on without interruption. During sleep one cannot recognize time, and should be led to conclude that it had been interrupted. But the consideration of the objective world, which has progressed during one's sleep, shows that the discontinuity of time is only apparent, and that it has really progressed without interruption. Secondly, the linear nature of time. Time is a constant magnitude of such a nature that it is possible to pass from one definite value to another, only in one way. This is the same as to designate time as having one dimension. Thirdly, time never returns to a point or value which has once passed, and is thus to be distinguished from a line (with which it has much in common), since a line can be easily so drawn that it will cut itself. Fourthly, time moves on in one definite order. This is absolute, and a given succession in time cannot be reversed.

Canadian Nickel Mining.

Near Sudbury, Ontario, Canada, is a region 70 miles long, 40 miles wide, in which are deposits of nickel ranging from small pockets to hills of ore assaying 3% nickel, 3% copper and about 3% each of iron and sulphur. There are about ten mines producing in the aggregate 700 tons of ore daily, which is reduced to matte in the proportion of 7 to 1, partially burning out the sulphur, reducing that component after about ten weeks' combustion to about 7%. The ore, self-fluxing, is then coarsely crushed and smelted, producing a 40% matte, which is shipped for refining to the Orford Copper Co., N. J. The Canadian Cop-

per Co. of Cleveland, Ohio, and the Mond Nickel Co. of London, two of the largest companies there, are putting in plants designed to produce an 80% matte, to be shipped to their refining plants, the idea being to ultimately separate and utilize all the by-products of the ore.

It is also expected that the sulphur extracted

will be utilized in the manufacture of sulphide pulp; that sulphuric acid will be produced in large commercial quantities, and that nickel-steel rails and plate will be produced. Meanwhile the Canadian government proposes an export tax of \$7 per ton on nickel ore and a still greater duty on matte, to encourage such "home production."

Barren Zones.

In mining, an ounce of proved fact is worth a ton of unproved theory. There are many theories as yet unproved. There are, too, many substantial facts, generally known now, that were once unproved theories. One of those theories, concerning barren zones, is fast becoming an established fact. It is the old problem in a new phase, "Do mines go down?"

In the majority of cases there comes a time in the development of a mine when zones barren of all ore are encountered. This generally occurs in the case of sulphide ores when what may be styled the permanent water level is reached, and continues through what may similarly be termed the ebb and flow water line.

The theory here comes in that through the seasons this permanent water line rises and recedes, sometimes in Time's countless eons being higher or lower than at others, the ore becoming decomposed and the ores being leached out, new ore bodies meanwhile forming containing no metallic value, occasioning a barren zone. Another theory takes up the dissolving of metals by hot alkaline water, carbonic acid being present, which, meeting with volcanic gases from below, would precipitate metals "along the lines of least resistance," thus again occasioning barren zones, the character of the rock through which the vein in its entirety passed not being throughout its entire extent favorable to the deposition of ore.

The possession of sufficient nerve and money has demonstrated the existence of paying ore bodies below such barren zones. Whatever the cause, the theory that such barren zones actually exist has passed into the stage of accepted fact, it having been found that below such barren zones existed ore of equal value with that above, and that the permanent water line no longer marked the limit of profitable mining. The fact has been demonstrated in deep mining in California, Colorado and Montana, where some of the best paying mines were once abandoned till modern mining methods permitted deeper working. In Amador county, Cal., the Kennedy gold mine, one of the richest in the State, was barren of all pay ore for nearly 200 feet in depth. In Calaveras county the great Gwin mine was once sold for a song because of the occurrence of a barren zone. In Sierra county, Cal., the Sierra Buttes mine was worked to a depth of nearly 3000 feet, when a "barren zone" was encountered, and this property, which once operated ninety-six stamps and has a record of \$15,000,000 output, is now abandoned. In Montana the Comet-Rumley mine at Comet, Jefferson county, was a big silver-lead producer, when at a depth of 1500

feet the ore gave out, but upon sinking through a "barren zone" of 60 feet a body of galena 8 feet wide was found, and the mine's output was greater than ever. The same conditions are demonstrable in Cripple Creek and elsewhere in Colorado.

Feeding Water in Stamp Mills.

The editorial in the issue of January 12 on stamp-milling methods has elicited the usual amount of discussion on this subject, which is one of ever-present interest. Among other practical suggestions comes an inquiry as to probable or possible improvement or alteration in the method of feeding water into mortar boxes.

In connection with this detail is brought to mind the criticism some time ago of an eminent Canadian mining engineer, Mr. Bernard Macdonald, manager of the British American Corporation at Rossland, B. C., where, in consideration of possible defects or probable improvement in stamp-milling methods, he advocates a change in one detail, saying:

In considering this question it should be understood that a continuous and uniform stream of water is required in the mortars of the stamp mill to mix with and form a thin pulp of the ore as it becomes pulverized beneath the blows of the falling stamps, and in this condition (thin pulp) to carry it in suspension until discharged through the screen meshes.

It is customary to introduce the water required for this purpose over the top of the mortar in iron pipes or rubber hose. Thus introduced, the water falls about 3 feet before it reaches the top level of the pulp mass in the mortar, where it is still about 7 inches above the crushing surfaces of the shoes and dies. On reaching this position it will be seen that a large portion of it must of necessity be discharged from the mortar before it can be mixed with the ore as it is pulverized. Therefore, such portion fails to effect the purpose for which it was introduced. But perhaps the greatest defect in this system is the fact that the feedwater falling on the pulp mass has a tendency to settle the fine sands and slimes below the discharge level, which not only lessens the discharging capacity of the mortar, but subjects the fine sands to further pulverization after having reached the proper degree of fineness to pass through the screens, thus producing loss by sliming the pulp and unnecessary abrasion of the free gold particles.

The points of superiority claimed for the improved method are that the water, being introduced below or on a level with the crushing surfaces of the shoes and dies under a static head, sweeps off at once from the dies and between them such portion of the ore as has been reduced to a sufficient degree of fineness, and carries it upward into the pulp mass, where it is immediately presented with the most favorable opportunity of being splashed through the battery screens. This removes, to a very considerable degree, the cause of sliming the pulp for which the stamp mill has been noted, and, as will readily be seen, increases the discharging capacity of the mortar and, hence, its crushing capacity. In thus washing away the fine sands and slimes from around the dies, leaving only the coarser particles of ore to occupy these spaces, a favorite receptacle is provided into which the coarse gold may settle and be protected from unnecessary abrasion. Were the water introduced in the customary way, the spaces around the dies would be packed with an impenetrable mass of silt, which would offer no hiding place for the coarse gold, which would be lashed hither and thither through the mortar, losing by abrasion with every contact between the stamps and dies or with the sharp quartz. The points of advantage in this method are: Increase of crushing capacity; decrease of sliming; preparation of the bottom of the mortar to retain and protecting the coarse gold from abrasion.

Where the aim and intent is to make the process one of inside amalgamation—as in Colorado—saving the maximum of gold within the mortar box, the feasibility of Mr. Macdonald's suggestion must remain unsettled in the absence of conclusive experiments, though the matter merits most exhaustive test from an economical standpoint.

Regarding the decrease in sliming which is sought to be attained in some cases, further reference may be made to the European practice of setting the dies in the mortar box in a bed of cement, reaching almost up flush with the surface of the dies. This is claimed by its adherents to occasion an increase in the duty of the stamp by securing easier access to the screen by the crushed ore, and there being no corners to be broken, the wearing away of the dies causing the cement to assume a trough-like shape, thus tending to keep the ore directly under the stamp. This plan would necessitate smashing the cement setting whenever removal of the dies was desired, and while it may be all that is claimed for it, the practice will not be likely to meet with immediate favor.

London Promotion Methods.

Like other long-established conservative systems, the London mine promoter has certain ways of his own, and it is a waste of time on the part of the American mine owner or any one else to attempt change therein. An American mining man in London rightly introduced will be speedily ushered into the right promoting circle, a very limited one. He may take all the time he desires to explain that their methods are wrong and his right; he will be courteously listened to and gravely answered that there is doubtless a good deal in what he is saying, and he is then left to learn by experience that there are no changes. They have the game; they are the dealers, and any one who wants to play must conform to the rules of the game as established by them.

As said, there are a few absolutely reliable promotion houses in London. If one of these slow-going respectable concerns takes up a project it has considerable assurance of attention. The general public, the British capitalist possessed of inclination and ability to invest, relies almost solely on what these promoters say. The investor does not do much inquiring whether the property is in California or Australia or Mexico. He is at times a big investor, but is always a poor hand at investigation. The question with him is who is behind it in London. If the promoter has his confidence he doesn't care whether it is a Milwaukee brewery or a Montana copper mine; a California hydraulic proposition or a Chicago patent medicine plant; it is enough for him to know that So-and-So, doing business at the old stand in London when George III was King, says it is all right. He believes what the promoters tell him. If they advise investment the money is ready. He goes on the assumption that they have done the investigating and know all about it, or they wouldn't advise him to go into it. It is a matter of confidence, of commercial integrity, of financial belief.

Of course with such promoters it is necessary for the continuance of such a high position that they preserve what cost so much work and worry and time to secure. Confidence is a plant of slow growth; and a London promoter that can induce such trust and belief must have years of honest, honorable, intelligent and satisfactory work behind him. He has to be continually careful of his name and reputation; he must indorse nothing but what seems to him a gilt-edged proposition and must tell the truth about it. He must do a good many expensive things; he must be in touch with likely investors; know the town and country thoroughly, and be in a position to stand by what he says and even, at times, take care of the stock after actual issuance in case of a scare. He must keep out of questionable situations, and not allow failure to be connected with his name. When such a London promoter is found—and there are a few of the genus—he is a shrewd, conservative, honorable man, who is slow in promises, certain in performance.

Naturally he wants to make money, and if the thing proffered is big enough or apparently profitable enough he will look it over and say yes or no at his leisure. He will also want a big slice of it; indeed, may be willing to give the foreign owner the slice and take the rest. He does not ask the American or the Australian or the Mexican to guarantee profits. He says, "We will give you so much (or so little) for your property. What we get out of it or sell it for is our business." There is no sentiment about him. He hasn't any more than the average share of insular prejudice against anything not fortunate enough to be under the British flag, and is about as square a citizen as any. The only thing he wants to be sure of is, "Is there a good, big profit in this thing for me, and a certain minimum profit of 5% in it for the investor?" If he finds that the property is being peddled around London he stops at once and declines further consideration of it.

Of course, this applies solely to the class of promoters in mind. As everywhere else, there are gold brick men in London, just as good as the genuine so far as surface appearances go—full of gas, glare and dazzle; specious and brazen; with promises and assurances and requests for advance money; with fine offices and ability to prepare a false prospectus. There are mock promoters just as there are mock mine managers and mock experts. Counterfeits of good money are co-existent with current coin everywhere.

Concentrates.

ICE, like any other solid, may be made colder than 32° F.

"ASSAY EVERYTHING" is a good rule for the prospector.

ENGLISH GOLD COINS have one-twelfth copper alloy; American, one-tenth.

PROBABLY a fair average of the general cost of crushing ore would be \$1 per ton.

ONE HUNDRED INCHES WATER falling 100 feet give a theoretical energy of 28 H. P.

ALUMINUM would be about twice as strong at 306° F. below zero as at ordinary temperature.

THE average amperage of an arc lamp is 9.6 amperes; of an incandescent lamp, one-half ampere.

CALLIUM, the rarest metal, is produced electrolytically, and is 230 times as expensive as gold.

GALLIUM is too rare a metal to have any commercial value beyond that attached to a chemical curio.

THE foreign postage on each issue of this paper is 3 cents. The price per year, foreign, is now \$4.50.

TO ANNEAL TOOL STEEL heat it red hot; then bury it in slaked lime or wood ashes, and allow it to cool.

It is believed that the loss of gold in water used in stamp milling is too infinitesimal to be taken into account.

CARBONATE OF SODA is the best remedy for boiler incrustations of carbonate of lime or sulphate, or both together.

THE chemicals used in the Stevens process are: Chloride of lime, nitric acid, muriatic acid, bromide of potash, chloride of sodium.

AN illustrated description of the Poetsch system of sinking a shaft through quicksand, etc., appeared in the issue of March 31, 1900.

STORIES of ghosts in mines are numerous and often given credence, but miners have mostly seen too many ghosts to believe in them.

THE standard of a foot of fuse is thirty seconds. The estimate that a foot of fuse will take one minute to burn is a dangerous one in practice.

THE silver bullion now in the Government vaults cost the Government 92.4 cents per ounce. Considerable silver coinage constantly goes on.

HYDROGEN can be readily produced by the action of hydrochloric acid on zinc. The temperature of an oxy-hydrogen flame is about 4000° F.

IN the last "Concentrate" in the first column on page 59 of the issue of Jan. 26 the word "molybdenum" should have been "wolframite."

ANYTHING in amalgamation that saves quicksilver saves gold. Wherever the quicksilver goes (except in volatilization) the gold goes with it.

A 5-INCH PIPE (actual inside diameter 5.045 inches) 10 feet long contains 2398.8 cubic inches. The area of the outside surface is 2.097 square inches.

WHEN the cyanide solution contains much copper it is precipitated on the zinc before the gold, coating it and retarding the precipitation of the latter.

A STANDARD candle power, a unit of light, one candle, is the light given out by a sperm candle, weighing six to the pound and burning 120 grains per hour.

IN a tank 4×4 inches at the bottom, 12×12 inches at the top, 10 feet high, the water stands 7 feet and six-tenths of an inch deep when tank is half full.

THE Stevens process is not considered a financial or commercial success. It is interesting, metallurgically—a distinction which it shares with other "processes."

THE Comstock Tunnel Co. long since succeeded to the rights of the Sutro, Nevada, tunnel. Their bonds are at present quotable in New York City at about 5 cents.

A PIECE of brass, 1 inch long, on heating it 1° F., will expand 0.0000104 inch; aluminum, 0.0000136 inch; lead, 0.0000163 inch; tin, 0.0000124 inch; zinc, 0.0000162 inch.

THE required vacuum in inches to remove all atmospheric pressure can be found by dividing the latter by .49. At sea level it is 14.7 pounds, and 14.7 ÷ .49 = 30 inches.

AT the Golden Cross 100-stamp mill at Hedges, San Diego county, Cal., the average yield of the 400 tons daily crushed is \$3 per ton; average cost of treatment, 74 cents per ton.

THE average cost of carrying material upon common roads with animal power is, approximately, 25 cents per ton per mile, ½ cent per ton per mile on steam railroads and 1 mill by water.

IF the apex of a vein crosses one end line and one side line of a lode mining claim as located thereon, the locator of such vein can follow it upon its dip beyond the vertical side line of his location.

THERE is nothing statutory to prevent anyone writing "M. E." after his name, and claiming to be a mining engineer, though those who have a just claim to that title are often rightly indignant at its gross misuse.

SINCE the first of this year the American Smelting & Refining Co. has not bought any British Columbia lead-silver ore. It is understood that the renewal of the

former contracts depends upon satisfactory settlement of freight rates on ores between the managers of the trust and the Canadian Pacific Railway.

THE Secretan copper corner was an attempt by a French syndicate engineered by M. Secretan in 1888 to control the world's copper output, the price being forced from \$190 to \$520 per ton. The scheme collapsed in March, 1889.

PROPERLY roasted, there need be no insuperable obstacle to successful chlorination of gold ore carrying 3% each of antimony, zinc and arsenic, though thorough and exhaustive tests of a "mill run" would be well before considering a plant.

THE thickness of a standard iron, lap-welded tube is .109 inch; the internal diameter is 3—(.109×2)=2.782 inches, and the internal diameter 8.74 inches; in a 15-foot tube there would thus be 10.925 square feet, or .72833 square foot for each linear foot.

A MUFFLE FURNACE would be useful for roasting arsenical ores, where the oxide of arsenic is caught in condensing chambers and sold, for the roasting of sulphide of gold precipitate in chlorination, and for roasting gold-zinc slimes resulting from the cyanide process.

IN a double-compartment shaft 900 feet deep, with a double-cylinder engine, 60-inch stroke, ninety pounds steam, to lift six tons, the steel rope should be 1½ inches diameter; it would weigh two pounds to the foot, and would coil in two layers on an 8-foot drum 30 inches long.

MANY books on electricity and cognate topics are written to glorify the writers, rather than to afford information. A good way to get the rudimentary information requisite in practical life is to get some standard electrical journal in connection with practice with competent men.

AN ordinary magnifying glass can be used as a substitute for the lens in a camera, in taking landscapes, by making it opaque all but a small circle in the middle. A glass 2 inches in diameter should be covered except a circle ⅜-inch diameter in the center. With a larger opening, the center and edges of the picture would not be in focus.

IN sampling silver-lead bullion bars it may happen that samples taken by chipping out of the top and bottom of each bar would give a result less than the actual value of the bar, as that part of the bullion lying against the sides of the mold is liable to be richer in silver, of which none would be obtained in the top and bottom chip sample.

THERE are flumes in irrigating ditches in California, where the water carries considerable sediment, fitted with riffles and charged with quicksilver. One in Tuolumne county has been in use twenty-five years and has yielded \$3000 in one year. Men have placed sheepskins with the wool on in muddy streams and cleaned up a living from them.

THE "silver plant" is found in Montana and the foothills of the Rocky mountains. Botanists call it "Eriogonum ovalifolium." Prospectors regard it as an indication of silver ore in the soil on which it grows. It grows in low, dense tufts and turf-like bunches, has small leaves coated with a thick white fur, and has a head of minute rose-colored flowers.

THE manufacture of Nevada borax is a simple process. "Cottonballs" in the eastern Nevada salt marsh valleys are found 3 inches under the soil; they average 4 inches diameter, and are scraped up into a wagon. At the works they are put into vats and boiled with soda, the water run off into settling tanks, the borax crystallizing on the sides and bottoms and on suspended zinc plates.

TAKING an average of say a dozen ore assays as the average value of the ore will always prove unsatisfactory, as the high assays will almost invariably make the apparent average value above what it really is. A mill run, from fair averaging sampling is quite a different thing; and while it may result much lower than the other method, will more nearly approximate the real value of the ore body.

COPPER PYRITES is easily scratched with a knife and crushes easily with a hammer. Iron pyrites does not scratch with a knife. Peacock copper is a chalcocypite or mixture of iron and copper pyrites, oxidation forming the blue and purple tints. Red oxide (cuprite) is the most valuable of copper ores, and generally carries gold and silver. It is sometimes mistaken for cinnabar. Its specific gravity is 6; that of cinnabar, 8.

THE cracking of a crucible is due to the walls containing moisture, which with quick heating is changed into steam, which, unable to escape, takes on a tension that the walls of the crucible can not resist. It is advisable to heat the crucible slowly before use, that the moisture may evaporate; this previous heating to be done even though the crucible has been well dried out, and not used for melting, but kept in a damp or cold room.

THE service and life of a belt can be increased by applying with a brush a composition made with equal parts of red lead, black lead, French yellow and litharge mixed with boiled linseed oil and japan—enough to make it dry quickly. This will produce a finely polished surface. A coat of the same composition may be applied if the rubber gets peeled from the surface of the belt. Animal oils, grease and castor oil are injurious to rubber belts. Belts to be adjusted to the pulley should have the ends cut square and true and be cut shorter than the

distance around the pulley by ¼ to ½ inch for every foot when measured with a tape—a steel tape is the best. They should be stretched as tightly as possible, and with wide belts this can be done best by the use of clamps secured firmly to each end of the belt. A belt of good quality, 6 inches wide and three ply thick, will stand a direct strain of 5000 pounds.

A MINING LOCATION, including assessments, is completed when mineral-bearing rock has been found in place at 10 feet, or greater distance; the boundaries of the claim clearly marked, and a record of the same filed with the proper recorder; no further work is required that year; but during the following year, commencing January 1st, after the location, the annual labor of \$100 must be performed. The Act of Congress, 1880, Section 2, amending Section 2324 of the Revised Statutes of the United States, provides that the period within which the work is required to be done annually on all unpatented mineral claims shall commence on the first day of January succeeding the date of location of such claim.

ALUMINUM CABLES for long-distance electrical transmission are now in use in California, Washington and New York. Between Niagara Falls and Buffalo, N. Y., the Niagara Falls Power Co. is building a second transmission line, which, when in operation with the first line built, will supply the latter locality with 30,000 electrical H. P. The first of these lines consists of six copper cables—two three-phase systems—each cable having nineteen strands, on poles 75 feet apart. The second line, now building, is of aluminum, having 300,000 circular mils cross-section, thirty-seven strands to each cable. Being lighter than copper, it admits of placing the poles 112½ feet apart. When finished, both lines will be worked at 22,000 volts.

THE real, or intrinsic, value of gold is what a given weight of it will bring when it is exchanged for something else; the stamp of the Government mint adds nothing to the value of the gold, in a coin—it acts simply as a Government assay certificate to certify that the piece so stamped contains a certain weight of gold. It is the weight of the gold alone that gives the coin its exchange value, and, what is the same thing, its money value; the names "dollar," "quarter-eagle," "half-eagle," "eagle" or "double-eagle" being used solely to indicate that the coin contains 23.22 grains of fine gold, or multiples thereof. In proof of this, if a gold coin is of "light" weight because of mutilation or abrasion from use, it is not exchangeable at its face value.

THE multiple-cylinder engine is considered more economical and efficient than a single-cylinder engine, chiefly because the extremes of temperature are more closely kept together. Steam at 200 pounds pressure has a temperature of 387° F.; at atmospheric pressure, 212° F.—a difference of 175° which the steam thus indicated has to pass through at every stroke of the piston. If a condenser is used and the temperature reduced to 160°, the difference becomes 227°—a big variation for the walls of a cylinder to pass through twice during each stroke of an engine. When this expansion by the use of three or four cylinders is cut up into as many parts, there is a corresponding division of difference in temperature, the advantage of which more than counterbalances the increased friction.

A U. S. PATENT for mineral land is obtained as follows: The claimant, having complied with all legal requirements, may file in the proper land office an application for a patent, under oath, showing such compliance, together with a plat and field notes of the claim or claims in common, made by or under the direction of the U. S. Surveyor-General, showing accurately the boundaries of the claim or claims, distinctly marked by monuments on the ground, and post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat, previous to the filing of the application for a patent, and file an affidavit of at least two persons that such notice has been duly posted, and file a copy of the notice in such land office. Thereupon the claimant is entitled to a patent for the land in the manner following: The register of the land office, upon the filing of such application, plat, field notes, notices and affidavits, publishes a notice that application has been made, for a period of sixty days, in a newspaper to be by him designated published nearest to such claim; and he also posts such notice in his office for the same period. The claimant at the time of filing the application, or at any time thereafter within the sixty days of publication, files with the register a certificate of the U. S. Surveyor-General that \$500 worth of labor has been expended or improvements made upon the claim by himself or grantors; that the plat is correct, with such further description by such reference to natural objects or permanent monuments as shall identify the claim, and furnishes an accurate description, to be incorporated in the patent. At the expiration of the sixty days of publication the claimant files his affidavit, showing that the plat and notice have been posted in a conspicuous place on the claim during such period of publication. If no adverse claim shall have been filed with the register and the receiver of the proper land office at the expiration of the sixty days of publication, it is assumed that the applicant is entitled to a patent, upon the payment to the proper officer of \$5 per acre, and that no adverse claim exists; and thereafter no objection from third parties to the issuance of a patent can be heard, except it be shown that the applicant has failed to comply with the above terms.

Gold Precipitation From Cyanide Solutions.

Methods in use for the precipitation of gold from cyanide solutions are by means of zinc, either in the form of dust or shavings; by charcoal; by zinc thread, coated with lead and obtained by momentarily immersing the zinc in a solution of lead acetate; by electrolysis with various electrodes, such as the Siemens-Halske process, which uses iron anodes and lead cathodes; or the Andreoli patented process, consisting of peroxide of lead anodes and iron cathodes, the iron cathodes being immersed in a lead bath to take off the gold. There is also the Cowper-Coles method of aluminum cathodes, which gives good results on a small scale. In this the gold comes down up to a certain point very well, but afterwards aluminum hydrates and lime precipitate on the aluminum plates, interfering with further deposition of the gold. With pure solutions the method is commendable, the amount of aluminum consumed less than the amount of gold precipitated, in the ratio of 100 to 125. Cyanide solutions being alkaline, aluminum hydrate forms readily, and, of course, it would not do to use an acid solution, as the gold cyanide would separate out. Most of the research work is done on the ordinary alkaline cyanide solutions, which leaves very little scope for successful chemical reaction in the precipitation of gold. For example, one could not precipitate sulphate of iron, or oxalic acid, or stannous chloride. With acid solutions it is different, and there are various methods which work well theoretically and practically, but their adoption on a commercial basis would depend on the failure of the zinc, charcoal and electrical methods of precipitation.

Where there are very base solutions to treat, which contain copper or other metals which would deposit on the zinc first and prevent the gold adhering, or choked up the charcoal pores, other methods would have to be used. The cyanide liquors are weak in cyanide when they have acted on the gold and are easily acidified, the acid required being very small unless there are carbonates in solution. On acidifying the gold-cyanide separates out as a yellow precipitate, but on heating the solution by means of steam pipes the whole of the gold may be thrown down by stannous chloride as a brown powder, which quickly settles to the bottom of the vat. If there is any stannic chloride present, purple of cassius will be formed and the gold will be in a much finer state of division. The gold thus precipitated by stannous chloride can not be caught by mercury, as it will not readily amalgamate, so that if this method were used the gold could be allowed to accumulate at the bottom of the tank until a sufficient quantity was obtained for a clean-up.

Gold-cyanide is a stable salt, insoluble in water or single acids, and aqua regia attacks it slowly. It is not acted on by hydrogen-sulphide, but is soluble in alkaline sulphides, ammonia, sodium, hyposulphite and KCN, and is split up on boiling with KHO to $KAu(CN)_2$ and Au.

Another method which could be used for collecting the gold consists in adding a certain amount of lead acetate to the acidified cyanide solution, heating to boiling and then precipitating with H_2S (sulphuretted hydrogen), the gold completely precipitated and easily collected by the lead sulphide, the precipitate dried and assayed for gold in the ordinary way. This method is shorter when assaying very poor solutions for gold than the ordinary evaporation method, and might be adopted on a large scale and the auriferous lead-sulphide sold to smelters. Sulphate of copper might also be used instead of lead, and the resulting sulphide of copper roasted and treated with sulphuric acid, forming copper sulphate, and the gold would be in the residue. The gold in the precipitate may be in the form of sulphide or partly free gold, as there is always a little free sulphur, which would indicate a decomposition of something, not lead sulphide, but the gold is precipitated. Gold-cyanide ought to be decomposed by passing through filters of metallic sulphides: $2AuCN + PbS = Pb(CN)_2 + 2Au + S$, or by oxalic acid: $2AuCN + H_2C_2O_4 = 2Au + 2HCN + 2CO_2$.

It is difficult to get reliable results of charcoal precipitation. One compiler of experiments with the cyanide process mentions a plant where the charcoal extracted 95% of the gold, and the liquors leaving the plant only assayed two grains of gold per ton of solution, but in this case an auxiliary zinc box was probably used, and it is not stated how much gold was in the liquors when they left the charcoal towers. The charcoal method of precipitation is in operation at the Mount Morgan mine, Australia. The auriferous liquors obtained by the chlorination process are first passed through sand filters to take out any suspended slimes, which would block up the channel. These sand filters are round, lead-lined vats, with a false bottom of perforated wood, on which a layer is made of pebbles 4 inches deep, and then a layer of sand 8 inches deep. From these sand filters the liquors pass to the charcoal filters, which consist of vats provided with a perforated false bottom covered with a cheesecloth, on which rests a layer of 5 inches of coarse charcoal—that is, charcoal which will pass through a 20-mesh sieve, but not through a 30-mesh—and on this comes a

layer of fine charcoal—that is, charcoal that passes through a 30-mesh sieve, but not through a 40-mesh—to a depth of 2 feet; on top of this is placed a layer of 5 inches coarse, the whole being covered with a sheet of perforated lead, weighted to keep the charcoal from floating. The charcoal is stamped down tightly, especially around the sides. The greatest deposition of gold is said to take place in the upper layer of the fine charcoal. The liquors on passing the charcoal filters still contain a trace of gold, so they are passed through an auxiliary filter of sifted sawdust, and after leaving this filter they are stated to be absolutely free from gold. The sawdust is burned every six months, and the product, being chiefly oxide of iron, containing from 200 to 300 ounces of gold per ton, is sold to smelters.

The charcoal is burned off in a small reverberatory and the resulting ash is smelted with soda ash, sand and borax in graphite crucibles. The question is whether the sawdust filter would take the last traces of gold out of a cyanide solution as it does out of a chlorine solution. It is easier to decompose chloride of gold than cyanide of gold. In this country the charcoal precipitation is not in as much favor as zinc. On this subject Philip Argall says: "Zinc, in the form of shavings, and also zinc dust, is used to precipitate gold, the latter, we believe, being preferable when adapted as a continuous process, more especially as the action is quicker and less zinc is required per ounce of bullion precipitated, and for solutions running from 0.05% cyanide upwards, and low in gold, it is likely to continue the best precipitant for a considerable time to come." He also discredits the notion that zinc in the KCN solution has any very great influence on the solvent power. There seems to be an idea among some metallurgists that charcoal destroys more KCN than zinc. This may be so with strong solutions, but hardly so with the very weak solutions now used. Theoretically, the consumption is the same, as the following equations show:

Electrolytic action takes place in both cases through the formation of couples by the precipitant and solution, water being slightly decomposed and hydrogen and oxygen being evolved. The hydrogen escapes free, but the oxygen combines with the HCN to form HCNO. Some authorities say that the hydrogen is caused by the action of the KHO on the zinc, but this explanation will not answer for the charcoal precipitation, as there is no chemical action on charcoal with KHO, as there is on zinc, so that electrolytic action is the only solution. Charcoal with weak solutions will in some localities always be favored in comparison with electrolytic methods, on account of its simplicity of working and satisfactory extraction with warm solutions.

Los Angeles, Cal., Items.

James Irving of Los Angeles has just returned from a three days' trip to Catalina island, whence he brought samples of gold-bearing galena from properties owned by the Cheny Valley Silver & Lead M. Co. of San Pedro. The mines from which these samples were taken are old workings, 18 miles northwest of Avalon.

C. A. Burcham of the Yellow Aster mine, Randsburg, has gone to San Francisco. His new 100-stamp mill is nearing completion.

W. T. Smith of Los Angeles, who has handled considerable of the output of the Coolgardie diggings, which are located 25 miles northeast of Barstow, states that from dry washings before the rain there was a weekly product of from \$1500 to \$2000, and before long this will reach \$5000 to \$10,000 weekly. Mr. Smith considers this one of the best gold placer finds that has taken place in southern California during the past fifteen years.

Los Angeles, Jan. 26, 1901.

Technical Societies.

The seventh annual meeting of the Lake Superior Mining Institute will be held in the "Copper Country," with headquarters at Houghton, March 5, 6, 7 and 8, 1901.

The Technical Society of the Pacific Coast, Academy of Sciences, San Francisco, has elected the following named officers: President, Chas. D. Marx; vice-president, David C. Henny; secretary, Otto von Geldern; treasurer, Edward Schild; directors, Paul W. Prutzman, Samuel C. Irving, Luther Wagoner, Adolf Lietz, Edward F. Haas.

The eightieth meeting—thirty-first annual meeting—of the American Institute of Mining Engineers will be held at Richmond, Va., beginning Feb. 19th.

THE advantages of the electric firing of explosives, from the standpoint of accuracy and safety, are shown in the experience of German collieries, as recorded in an official report. In one colliery no misfire occurred out of 1663 shots fired; in five other collieries of the district there were 548 misfires out of the total of 34,207 shots, a proportion of 1.6%.

Cornish and Direct-Acting Duplex Pumps.*

Written by J. RENSCHAW, Denver, Colo.

The following comparisons of the relative advantages of the higher grades of direct-acting, duplex steam pumps, as compared with the old and well-tried Cornish system, refer to permanent pumping plants for mines in which the water is below the temperature of about 70° or 75° Fahr. When the water is above that temperature it is evident that the exhaust steam from the direct-acting steam pumps cannot be advantageously disposed of, and either the Cornish pump or some other plan, in which the motive power is located at the surface, must be used.

Up to 1878 one of the various modifications of the Cornish pump was exclusively used, both in Europe and in this country. In that year a simple cylinder, non-condensing, single-plunger pump at the Ontario mine, Utah, with 12-inch plungers, 4-inch stroke, and 500 feet vertical lift, was altered into a compound, condensing pump by the addition of an expansion cylinder and a spool-shaped bushing put in the original cylinder, the space between the original bore and the outside of the bushing forming a steam jacket. This pump was, we believe, the first attempt toward a higher grade direct-acting steam pump located in lower workings for permanent mine pumping. It was thoroughly tested first by the writer and then by the designer of a Cornish pump which had been selected by the writer to be put in should the other not prove economical. It met with strong opposition, mainly from the builders of the Cornish pumps, both in California and the East, and with much skepticism of Eastern mine operators, principally, we think, with the belief that steam could not be conducted in pipes a long distance without a ruinous loss by condensation, and this idea held among many not familiar with the results of the compound, direct-acting, condensing steam pumps that had been put in, until 1884 and 1886, when they were put in a mine at Leadville and in one at Ishpeming, Mich., since which time very few Cornish pumps have been built in this country.

In 1882 or 1883 a Cornish pump was built for the Ontario mine, which is no doubt the best example of that style of pump built, at least in this country. The writer had no opportunity to test it, but the manager of the mine said that he thought it saved a little in steam over the crude, direct-acting, condensing steam pumps that had been installed in that mine. When asked if he was sure also saving any steam, he replied that he was not, and later advised a mine operator in Leadville to put in the direct-acting, duplex condensing pump as against the Cornish pump, as the difference in cost more than balanced the possible saving in steam.

We know of no publicly reported experiments having been made to determine the amount of condensation in steam pipes until a series was made by the New England Board of Underwriters, and reported in the transactions of the American Society of Mechanical Engineers. The result then had on pipes covered with 1 inch of hair felt, and tilted by a thickness of burlaps, coincided almost exactly with what we had determined at the Ontario mine with the same thickness of hair felt covered with 10-ounce canvas. At the Wolfstone mine at Leadville the condensation in 585 feet of 4-inch wrought iron pipe, covered with $\frac{1}{8}$ inch of asbestos paper, $\frac{1}{8}$ inch of hair felt, and this covered with painted 10-ounce canvas, was 57.75 cubic inches per minute, or 8.396 cubic inches per minute for each hundred square feet of external pipe surface.

Judging by past experience, there is little difference in "duty" between the best examples of Cornish pumps and the best examples of direct-acting, compound condensing pumps, each for, say, 1000 gallons per minute lifted 1000 feet vertical.

With triple-expansion, direct-acting, condensing pumps with the initial steam pressure at the pump at 140 pounds, and the pump running at, say, 125 feet piston speed, the comparison would undoubtedly be much in favor of it over the Cornish pump.

There are, however, other very important considerations to the mine operator as to the relative advantages of the two systems of pumping, besides a little difference in the steam economy. On a basis of 1000 gallons lifted 1000 feet per minute the installed cost of the direct-acting pump will not reach 10% of that of the Cornish pump. In most cases the working out of the mine beneath the foundations of the Cornish pump engines will, by settlement, throw it out of line, it not being a self-contained machine like the direct-acting pump. So, also, with the "pit work."

Another very important consideration is the expansibility—if we may so call it—of the two systems. When the size of a Cornish pump is to be determined, a large margin for increase of water through greater depth or side workings has to be allowed for, and what this margin is to be is difficult to determine. As a rule, but one Cornish pump can be installed in the one-pump compartment of the shaft and it cannot be replaced by another without allowing the shaft to be flooded; and it is a question if it could be

* Bulletin No. 18, California State Mining Bureau.

taken out as fast as the water would rise. This would depend on the amount of ground worked out. Frequently there is allowed a greater margin for increase of water than afterwards proves necessary, either from the ore body giving out or less water being encountered than expected. The interest on investment and wear and tear of a larger machine than necessary are important considerations; or it may be years before the full capacity of the pump is called for. On the other hand, if too small a pump is put in, a new shaft has to be put down in which to install another larger pump. Thus the size of the pump has to be determined once for all.

Not so, however, with the direct-acting pump. They need only be bought as depth is attained or increase of size becomes necessary. If the pump proves too small, a larger one may be installed on the pump station and the smaller one moved down to a lower level, where the ground has been opened, and so on, making pump stations every 500 or 1000 feet. If the column pipe for the first pump put in is not of sufficient size for the larger pump, there is generally room enough to put in a larger one, and the smaller pipe can then be used below for the smaller pump. The expenditure for pumps may thus be by increments as needed.

As we have said, pump shaft compartments are seldom large enough to install but one Cornish pump line, and "the egg" are all in one basket," whereas with direct-acting pumps two may be installed in the one station, both connected to one column pipe or each with its own, and in case of necessary repairs one may be stopped and the other started. It is very comfortable for the mine operator to feel thus secure.

If there are two or more compartments to the shaft, one of which is for pump, piping and ladders, that compartment should be well bratticed from the adjoining hoisting compartment. The heat radiated from even the well-covered steam pipe tends to make that compartment an "uptake" and the hoisting compartment a "downtake," and thus fairly good ventilation is to be had in the pump station or level.

We need hardly say that it is important to keep pipes and their bearers snugly to the sides of the shaft, so that there will be left a clear run for the rising of warm or foul air.

When, through the decomposition of pyrites or other minerals the water is too hot for the condensation of steam below, then either compressed air may be substituted for steam, electric or rope-driven power pumps, or the Cornish pump must be used. With the utilization of mountain streams as a source of power, and other electricity or compressed air to transmit it, comes a new feature in mine pumping which will be more and more used, as in most of the metal mining locations the cost of fuel is a "burning" question. The transmission of power to the station pump by electricity would present a simple solution of the difficulty were it not that the speed of the pump has to be varied, either because of increase of water by ground opened or by the seasons affecting the surface water. We think this difficulty can be overcome without uselessly expending power.

The above is given as a summary of the relative advantages of the two systems of mine pumping, for a part of which we have to rely upon memory, but we are substantially correct.

Chlorinating at Mount Morgan, Queensland.

At the new Test Works, which treats 100,000 tons per annum, the low grade gold ores are extracted with a previously prepared solution of chlorine in water, and are not gassed as in ordinary methods. In "Proceedings of the Institute of Civil Engineers," E. W. Nardin describes the plant, which consists of sixteen vats of 100 tons capacity each, four chlorine stills, four towers, four solution tanks, four gold liquor tanks, twelve charcoal filters, three vacuum pumps, three free pumps, and one driving engine. The chlorine is made from salt, manganese dioxide, and sulphuric acid, manufactured at the company's works from imported sulphur. The gas from the stills is dissolved in water trickling over pieces of glass, with which the towers are filled. The solution runs into the storage tanks, which are covered in at the top and worked by pipes and valves in the base operated from above. The vats have a wooden perforated false bottom and layers of gravel and sand of diminishing size are laid upon it. The internal dimensions are 60x12 feet with a depth between 5 feet at one end and 5½ feet at the other; 1½ feet of the depth is occupied by the prepared gravel bed. The ore is thrown in on the bed and the chlorine solution run in over it. The gold liquor is drawn through and out from below by small vacuum of five pounds per square inch, and passed on to the storage tanks. Fresh chlorine solution is run in until the exit liquor contains plenty of free chlorine, when the ore is washed through with water. The gold is precipitated by passing the liquor through a 2-foot bed of crushed ore lying on a cloth on the wooden perforated bottoms of the filtering vats, the cloth being afterwards burnt and the ashes sent to the metal. The cost worked out during one month at \$645 per ton, with ore of the average assay of 13 dw. 13 grains. The residue contained 22 grains, showing an extraction of 92.06%, the quan-

tity of ore treated being 9852 tons. The cost of the chlorine was 11.85 cents per pound, and the weight used per ton of ore was 2.51 pounds, the time under solution being thirty-three hours, and under water thirty-five hours. The average weight of chlorine per cubic foot of solution was 620 grains, and the still efficiency 72.59%. The richer sulphide ores, containing about four ounces of gold per ton, at the top works are, after roasting, treated by the same process, and show an extraction of 95% with a consumption of 11.47 pounds of chlorine per ton of ore. A new plant to treat 2000 tons of low grade sulphide ore per month is nearing completion.

Cyaniding Rock in Place.

"A little nonsense now and then
Is relished by the wisest men."

We are working a quartz ledge in the Salmon mountains of Siskiyou county, California, and our postoffice is Callahans, 50 miles from the mine. For obvious reasons, it will be understood why I do not locate the claim definitely. "There is me, and the cook, and the Portugee bold," to say nothing of Quo Vadis the mule, Cyrano the dog, and Taddles the cat. The snow is 10 feet deep on the level, and the new century is here. The Portugee is bewailing his fate: "Notra dam turk", notra dam Tom an' Jer', notra dam ting 'cept ham an' bac', an' snow, an' work-work-work!" He is too lazy to showshoe it out, and moreover, as we have but embryo bullion, which he declares to be bogus, and will have none of, what can we do toward paying him off? Neither old Joe nor I believe Manuel desires to leave. We have fired him several times during the past five years, paying him in coin of these U. S., or in I. O. U.'s, as the case might be, and after a howling week of jag at the nearest camp the Portugee, accompanied by R. E. Morse, has found himself again under our vine and fig tree (i. e., tunnel and shake roof), begging for "one dose de good-a bromo."

But I digress. This is the story of a new (?) process in gold mining, not the incidents of a Portugee's periodicals.

The snow is so deep, the wind so painfully mournful through the pines; there is such a lack of congeniality between men shut up in a cabin that I'm garrulous, even on paper.

Two years ago we found the Pizen Dog claim while digging a water hole above a spring. It did not crop, and the foot of quartz between diorite walls panned a good string of flour gold, so fine that it floated when the water was off the prospect for a moment, but it was good to look upon—a hundred-dollar prospect. We covered it, blazed some trees in a circle around the hole, and kept on our weary march northward, for we had the genuine and only Simon Pure map and description of the Lost Cabin claim, dated A. D. 1855, which Manuel's grandfather upon his deathbed had bequeathed to us while in Mexico—"but that's another story"—and the translation gave the most minute details; so we were sure of finding the diggings. Let me state here in parenthesis that the Lost Cabin placer mine, upon the headwaters of the Trinity river, was worked by two Portugees in the early fifties, and they took out all they could stagger under. One died with D. T. in San Francisco, the other was shanghaied. Manuel's grandfather's brother returned to Mexico broken in health, but the priest took his description of the mine and we have the original document.

You will say it was another "lost mine." It was, but we found it!—found it without the slightest trouble, and it paid as high as fifty ounces per day per man. Not to us—no such luck—but to some fortunate miners who stumbled upon it in the sixties and who worked out the little draw.

We had come 2000 miles and were flat broke, so while old Joe opened a set of books for a store, and Manuel dealt monte and hokey-pokey, I ran an arrastra for a farmer. In two months we had a stake to take us back to the Pizen Dog of the Salmon river.

The prospect was as we left it. We built a wickiup and started a tunnel to crosscut, that in 70 feet gave us backs of 50 feet upon the ledge which we followed, saving the ore.

We built a small arrastra, and Quo Vadis the mule worked a week, when the mine and gulch went dry—not enough water to drink, and the river two miles distant.

The vein is peculiar in some respects. The cleavage is horizontal and the quartz lies in ribboned layers with vertical minute open oxidized seams that carry the free gold. The matrix is apparently barren and the seam colors so fine that panning must be done under water; strike east and west; dip vertical; walls close, hard diorite.

Summer was upon us, so we cleaned up the arrastra. The yield was generous, for the ore was hand sorted. Manuel was sent for supplies to Cecilville, and old Joe and I began developing the pay chimney. We had 35 feet of drifts upon the ledge, when one morning old Joe threw down his hammer and danced out of the tunnel shouting, "By the shinbone of my paternal ancestor, I have it—Eureka!"

Men living in the mountains get "off" easily, so I held on to my drill and followed him out, trusting I

would not have more than temporary persuasion upon my hands. There he was, hornpiping it, bareheaded, under a sun of 105° F.

Poor old Joe. We have been partners, broke and affluent in several lands for twelve years, but I never saw him other than the staid and taciturn old Heidelberg student of metallurgy. He waved his arms and shouted, "Holy smoke, and we've been trying to amalgamate it! Blockheads! Stoughton Bottles! It's morogonous!"

"You see," he yelled, "2 Au plus 4 KCy plus O plus H₂O equals 2 Au KCy₂ plus 2 KOH, and that's a lovely equation!"

"Come along, old man, that's a good fellow." He was worse than I feared, babbling chemistry synonyms, and if Manuel had been there we could have strapped him down till the first flush of delirium was over.

Again he shouted, "But 2 KAucy₂ plus Zn, me bucco Ananias, yields K₂ Zn Cy₂ plus 2 Au—wow! And she's dry as a bone—percolation perfect!" Again he gave a warwhoop and waved his arms.

"Look here," I yelled, shaking him by the arm, "you come along with me and take a good dose of Manuel's bromo, and a sleep, and you'll—"

"What t'ell's matter with you? I've got it, I tell you—got it pat—the Pegleg and the Lost Cabin will be nothing to the case of purging the Pizen Dog. We'll give him the gold cure!" and he ambled again.

I sat in the shade and wiped my forehead. I think I wept a little. I was sick all over, but old Joe noticed my agitation and came to me.

"Just let me think it out," he said. "It's here, back in the gray matter all right, and bound to come in time. Resurgam!"

I lighted my pipe, but I never dropped the 2-foot drill. I sweat cold all over, but his next remarks sent me to my feet. "She is dry, isn't she? And the gold is free in the seams? We have 50 feet of backs, and 35 feet blocked out, say 125 tons at \$100, equals \$12,500. Now, why not pour on a cyanide solution, catch it in the drift, drain it into a vat, and precipitate it upon zinc shavings? It will work for us while we sleep, and it is worth trying."

We did no further physical work that day, but the strain upon our mental caliber was tense, and the pro and con resulted in my leaving for Cecilville to round up the mule and Manuel. The latter I alternately kicked and ducked into sobriety, for he was "loaded for bear," and the former I saddled and headed for the railroad 75 miles distant.

Old Joe and Manuel dug a trench along the surface of the shoot over the drift, made a set of receiving tanks, a pump, boxes for the zinc, and built a snug log cabin.

In three weeks I returned. The sample sent to the city assayed \$198.75 per ton, and by laboratory test 96½% was saved by the cyanide process. The cyanide, zinc, acids, treatises and grub were carefully packed in by Quo Vadis, and I was footsore and weary, but the first remark of old Joe tired me more: "Did you find how much royalty we have to pay to the patentees?" I had not, so we let it go at that and set to work.

With a makeshift plow we dug a small ditch 2½ miles long, and in five weeks had a trickle of water on the claim. We then carried a strong solution into the adit and held our breaths. Nothing percolated. The tunnel was as dry as a bone. We took turns and watched all night, and the drifts were, if anything, drier than ever. More solution, more examining, more wondering. We kept a steady flow into the adit, which absorbed it readily enough, and upon the third day the roof became wet in patches, then the drip came. We carried it in a trough to the mouth of the tunnel and into the zinc boxes. The trick was done, and the brown residue, slimy and uninteresting, was dried and carefully saved. Manuel was more excited than either of us, and his disgust upon seeing what we called gold was painful.

We worked for a month and then came on heavy rains, and cold weather followed fast. We made an upraise of 10 feet into the ledge, and apparently there is as much gold as before, in the seams, not acted upon by the solution, though the weight of our residue assures us that we have a generous return for our summer's work, and old Joe suggests renaming the mine the Widow's Cruet. Next spring we will attempt a totally new scheme for working the ledge and for saving values, and our dead work will be complete by the time the snow is off.

A CALIFORNIA MINER.

Callahans, Siskiyou Co., Cal., Jan. 15, 1901.

WOVEN WIRE GAUZE AND CLOTH is now made with meshes so infinitesimal as to number 40,000 of the latter to a single square inch. The more delicate classes of wire—those which stand related to scientific instruments—are of such fineness as to render their measurement a matter of difficulty; this task, however, has been made practicable, and platinum wire has been drawn 7000 of an inch and to even greater fineness. Aluminum wire, too, has been drawn as fine as 10,500 yards to the ounce, a size too fine to be measured practically by any gauge or instrument. Iron has also been so attenuated that over 2½ miles in length weighed only one ounce; a more remarkable instance of this class of mechanical manipulation is the drawing of twenty-four grains of gold on a silver wire to 120 miles.

Gold Precipitation From Cyanide Solutions.

Methods in use for the precipitation of gold from cyanide solutions are by means of zinc, either in the form of dust or shavings; by charcoal; by zinc thread, coated with lead and obtained by momentarily immersing the zinc in a solution of lead acetate; by electrolysis with various electrodes, such as the Siemens-Halske process, which uses iron anodes and lead cathodes; or the Andreoli patented process, consisting of peroxide of lead anodes and iron cathodes, the iron cathodes being immersed in a lead bath to take off the gold. There is also the Cowper-Coles method of aluminum cathodes, which gives good results on a small scale. In this the gold comes down up to a certain point very well, but afterwards aluminum hydrates and lime precipitate on the aluminum plates, interfering with further deposition of the gold. With pure solutions the method is commendable, the amount of aluminum consumed less than the amount of gold precipitated, in the ratio of 100 to 125. Cyanide solutions being alkaline, aluminum hydrate forms readily, and, of course, it would not do to use an acid solution, as the gold cyanide would separate out. Most of the research work is done on the ordinary alkaline cyanide solutions, which leaves very little scope for successful chemical reaction in the precipitation of gold. For example, one could not precipitate sulphate of iron, or oxalic acid, or stannous chloride. With acid solutions it is different, and there are various methods which work well theoretically and practically, but their adoption on a commercial basis would depend on the failure of the zinc, charcoal and electrical methods of precipitation.

Where there are very base solutions to treat, which contain copper or other metals which would deposit on the zinc first and prevent the gold adhering, or choked up the charcoal pores, other methods would have to be used. The cyanide liquors are weak in cyanide when they have acted on the gold and are easily acidified, the acid required being very small unless there are carbonates in solution. On acidifying the gold-cyanide separates out as a yellow precipitate, but on heating the solution by means of steam pipes the whole of the gold may be thrown down by stannous chloride as a brown powder, which quickly settles to the bottom of the vat. If there is any stannic chloride present, purple of cassius will be formed and the gold will be in a much finer state of division. The gold thus precipitated by stannous chloride can not be caught by mercury, as it will not readily amalgamate, so that if this method were used the gold could be allowed to accumulate at the bottom of the tank until a sufficient quantity was obtained for a clean-up.

Gold-cyanide is a stable salt, insoluble in water or single acids, and aqua regia attacks it slowly. It is not acted on by hydrogen-sulphide, but is soluble in alkaline sulphides, ammonia, sodium, hyposulphite and KCN, and is split up on boiling with KHO to $KAu(CN)_2$ and Au.

Another method which could be used for collecting the gold consists in adding a certain amount of lead acetate to the acidified cyanide solution, heating to boiling and then precipitating with H_2S (sulphuretted hydrogen), the gold completely precipitated and easily collected by the lead sulphide, the precipitate dried and assayed for gold in the ordinary way. This method is shorter when assaying very poor solutions for gold than the ordinary evaporation method, and might be adopted on a large scale and the auriferous lead-sulphide sold to smelters. Sulphate of copper might also be used instead of lead, and the resulting sulphide of copper roasted and treated with sulphuric acid, forming copper sulphate, and the gold would be in the residue. The gold in the precipitate may be in the form of sulphide or partly free gold, as there is always a little free sulphur, which would indicate a decomposition of something, not lead sulphide, but the gold is precipitated. Gold-cyanide ought to be decomposed by passing through filters of metallic sulphides: $2AuCN + PbS = Pb(CN)_2 + 2Au + S$, or by oxalic acid: $2AuCN + H_2C_2O_4 = 2Au + 2HCN + 2CO_2$.

It is difficult to get reliable results of charcoal precipitation. One compiler of experiments with the cyanide process mentions a plant where the charcoal extracted 95% of the gold, and the liquors leaving the plant only assayed two grains of gold per ton of solution, but in this case an auxiliary zinc box was probably used, and it is not stated how much gold was in the liquors when they left the charcoal towers. The charcoal method of precipitation is in operation at the Mount Morgan mine, Australia. The auriferous liquors obtained by the chlorination process are first passed through sand filters to take out any suspended slimes, which would block up the channel. These sand filters are round, lead-lined vats, with a false bottom of perforated wood, on which a layer is made of pebbles 4 inches deep, and then a layer of sand 8 inches deep. From these sand filters the liquors pass to the charcoal filters, which consist of vats provided with a perforated false bottom covered with a cheesecloth, on which rests a layer of 5 inches of coarse charcoal—that is, charcoal which will pass through a 20-mesh sieve, but not through a 30-mesh—and on this comes a

layer of fine charcoal—that is, charcoal that passes through a 30-mesh sieve, but not through a 40-mesh—to a depth of 2 feet; on top of this is placed a layer of 5 inches coarse, the whole being covered with a sheet of perforated lead, weighted to keep the charcoal from floating. The charcoal is stamped down tightly, especially around the sides. The greatest deposition of gold is said to take place in the upper layer of the fine charcoal. The liquors on passing the charcoal filters still contain a trace of gold, so they are passed through an auxiliary filter of sifted sawdust, and after leaving this filter they are stated to be absolutely free from gold. The sawdust is burned every six months, and the product, being chiefly oxide of iron, containing from 200 to 300 ounces of gold per ton, is sold to smelters.

The charcoal is burned off in a small reverberatory and the resulting ash is smelted with soda ash, sand and borax in graphite crucibles. The question is whether the sawdust filter would take the last traces of gold out of a cyanide solution as it does out of a chlorine solution. It is easier to decompose chloride of gold than cyanide of gold. In this country the charcoal precipitation is not in as much favor as zinc. On this subject Philip Argall says: "Zinc, in the form of shavings, and also zinc dust, is used to precipitate gold, the latter, we believe, being preferable when adapted as a continuous process, more especially as the action is quicker and less zinc is required per ounce of bullion precipitated, and for solutions running from 0.05% cyanide upwards, and low in gold, it is likely to continue the best precipitant for a considerable time to come." He also discredits the notion that zinc in the KCN solution has any very great influence on the solvent power. There seems to be an idea among some metallurgists that charcoal destroys more KCN than zinc. This may be so with strong solutions, but hardly so with the very weak solutions now used. Theoretically, the consumption is the same, as the following equations show:

Electrolytic action takes place in both cases through the formation of couples by the precipitant and solution, water being slightly decomposed and hydrogen and oxygen being evolved. The hydrogen escapes free, but the oxygen combines with the HCN to form HCN O . Some authorities say that the hydrogen is caused by the action of the KHO on the zinc, but this explanation will not answer for the charcoal precipitation, as there is no chemical action on charcoal with KHO, as there is on zinc, so that electrolytic action is the only solution. Charcoal with weak solutions will in some localities always be favored in comparison with electrolytic methods, on account of its simplicity of working and satisfactory extraction with warm solutions.

Los Angeles, Cal., Items.

James Irving of Los Angeles has just returned from a three days' trip to Catalina island, whence he brought samples of gold-bearing galena from properties owned by the Cheny Valley Silver & Lead M. Co. of San Pedro. The mines from which these samples were taken are old workings, 18 miles northwest of Avalon.

C. A. Burcham of the Yellow Aster mine, Randsburg, has gone to San Francisco. His new 100-stamp mill is nearing completion.

W. T. Smith of Los Angeles, who has handled considerable of the output of the Coolgardie diggings, which are located 25 miles northeast of Barstow, states that from dry washings before the rain there was a weekly product of from \$1500 to \$2000, and before long this will reach \$5000 to \$10,000 weekly. Mr. Smith considers this one of the best gold placer finds that has taken place in southern California during the past fifteen years.

Los Angeles, Jan. 26, 1901.

Technical Societies.

The seventh annual meeting of the Lake Superior Mining Institute will be held in the "Copper Country," with headquarters at Houghton, March 5, 6, 7 and 8, 1901.

The Technical Society of the Pacific Coast, Academy of Sciences, San Francisco, has elected the following named officers: President, Chas. D. Marx; vice-president, David C. Henny; secretary, Otto von Geldern; treasurer, Edward Schild; directors, Paul W. Prutzman, Samuel C. Irving, Luther Wagoner, Adolf Lietz, Edward F. Haas.

The eightieth meeting—thirty-first annual meeting—of the American Institute of Mining Engineers will be held at Richmond, Va., beginning Feb. 19th.

The advantages of the electric firing of explosives, from the standpoint of accuracy and safety, are shown in the experience of German collieries, as recorded in an official report. In one colliery no misfire occurred out of 1663 shots fired; in five other collieries of the district there were 548 misfires out of the total of 34,207 shots, a proportion of 1.6%.

Cornish and Direct-Acting Duplex Pumps.*

Written by J. RENSCHAW, Denver, Colo.

The following comparisons of the relative advantages of the higher grades of direct-acting, duplex steam pumps, as compared with the old and well-tried Cornish system, refer to permanent pumping plants for mines in which the water is below the temperature of about 70° or 75° Fahr. When the water is above that temperature it is evident that the exhaust steam from the direct-acting steam pumps cannot be advantageously disposed of, and either the Cornish pump or some other plan, in which the motive power is located at the surface, must be used.

Up to 1878 one of the various modifications of the Cornish pump was exclusively used, both in Europe and in this country. In that year a simple cylinder, non-condensing, single-plunger pump at the Ontario mine, Utah, with 12-inch plungers, 24-inch stroke, and 500 feet vertical lift, was altered into a compound, condensing pump by the addition of an expansion cylinder and a spool-shaped bushing put in the original cylinder, the space between the original bore and the outside of the bushing forming a steam jacket. This pump was, we believe, the first attempt toward a higher grade direct-acting steam pump located in lower workings for permanent mine pumping. It was thoroughly tested, first by the writer and then by the designer of a Cornish pump which had been selected by the writer to be put in should the other not prove economical. It met with strong opposition, mainly from the builders of the Cornish pumps, both in California and the East, and with much skepticism of Eastern mine operators, principally, we think, with the belief that steam could not be conducted in pipes a long distance without a ruinous loss by condensation, and this idea held among many not familiar with the results of the compound, direct-acting, condensing steam pumps that had been put in, until 1884 and 1886, when they were put in a mine at Leadville and in one in Ishpeming, Mich., since which time very few Cornish pumps have been built in this country.

In 1882 or 1883 a Cornish pump was built for the Ontario mine, which is no doubt the best example of that style of pump built, at least in this country. The writer had no opportunity to test it, but the manager of the mine said that he thought it saved a little in steam over the crude, direct-acting, condensing steam pumps that had been installed in that mine. When asked if he was sure as to saving any steam, he replied that he was not, and later advised a mine operator in Leadville to put in the direct-acting, duplex condensing pump as against the Cornish pump, as the difference in cost more than balanced the possible saving in steam.

We know of no publicly reported experiments having been made to determine the amount of condensation in steam pipes until a series was made by the New England Board of Underwriters, and reported in the transactions of the American Society of Mechanical Engineers. The result then had on pipes covered with 1 inch of hair felt, and that by a thickness of burlaps, coincided almost exactly with what we had determined at the Ontario mine with the same thickness of hair felt covered with 10-ounce canvas. At the Wolfstone mine at Leadville the condensation in 585 feet of 4-inch wrought iron pipe, covered with $\frac{1}{4}$ inch of asbestos paper, 1 inch of hair felt, and this covered with painted 10-ounce canvas, was 57.75 cubic inches per minute, or 8.396 cubic inches per minute for each hundred square feet of external pipe surface.

Judging by past experience, there is little difference in "duty" between the best examples of Cornish pumps and the best examples of direct-acting, compound condensing pumps, each for, say, 1000 gallons per minute lifted 1000 feet vertically.

With triple-expansion, direct-acting, condensing pumps with the initial steam pressure at the pump at 140 pounds, and the pump running at, say, 125 feet piston speed, the comparison would undoubtedly be much in favor of it over the Cornish pump.

There are, however, other very important considerations to the mine operator as to the relative advantages of the two systems of pumping, besides a little difference in the steam economy. On a basis of 1000 gallons lifted 1000 feet per minute, the installed cost of the direct-acting pump will not reach 10% of that of the Cornish pump. In most cases the working out of the mine beneath the foundations of the Cornish pump engines will, by settlement, throw it out of line, it not being a self-contained machine like the direct-acting pump. So, also, with the "pit work."

Another very important consideration is the expansibility—if we may so call it—of the two systems. When the size of a Cornish pump is to be determined, a large margin for increase of water through greater depth or side workings has to be allowed for, and what this margin is to be is difficult to determine. As a rule, but one Cornish pump can be installed in the one-pump compartment of the shaft, and it cannot be replaced by another without allowing the shaft to be flooded; and it is a question if it could be

* Bulletin No. 18, California State Mining Bureau.

taken out as fast as the water would rise. This would depend upon the amount of ground worked out. Frequently there is allowed a greater margin for increase of water than afterwards proves necessary, either from the ore body giving out or less water being encountered than expected. The interest on investment and wear and tear of a larger machine than necessary are important considerations; or it may be years before the full capacity of the pump is called for. On the other hand, if too small a pump is put in, a new shaft has to be put down in which to install another and larger pump. Thus the size of the pump has to be determined once for all.

Not so, however, with the direct-acting pump. They need only be bought as depth is attained or increase of size becomes necessary. If the pump proves too small, a larger one may be installed on the pump station and the smaller one moved down to a lower level, where less ground has been opened, and so on, making pump stations every 500 or 1000 feet. If the column pipe for the first pump put in is not of sufficient size for the larger pump, there is generally room enough to put in a larger one, and the smaller pipe can then be used below for the smaller pump. The expenditure for pumps may thus be by increments as needed.

As we have said, pump shaft compartments are seldom large enough to install but one Cornish pump line, and "the eggs are all in one basket," whereas with direct-acting pumps two may be installed in the one station, both connected to one column pipe or each with its own, and in case of necessary repairs one may be stopped and the other started. It is very comfortable for the mine operator to feel thus secure.

If there are two or more compartments to the shaft, one of which is for pump, piping and ladders, that compartment should be well bratticed from the adjoining hoisting compartment. The heat radiated from even the well-covered steam pipe tends to make that compartment an "uptake" and the hoisting compartment a "downtake," and thus fairly good ventilation is to be had in the pump station or level.

We need hardly say that it is important to keep pipes and their bearers snugly to the sides of the shaft, so that there will be left a clear run for the rising of warm or foul air.

When, through the decomposition of pyrites or other minerals, the water is too hot for the condensation of steam below, then either compressed air may be substituted for steam, electric or rope-driven power pumps, or the Cornish pump must be used. With the utilization of mountain streams as a source of power, and either electricity or compressed air to transmit it, comes a new feature in mine pumping which will be more and more used, as in most of the metal mining locations the cost of fuel is a "burning" question. The transmission of power to the station pump by electricity would present a simple solution of the difficulty were it not that the speed of the pump has to be varied, either because of increase of water by ground opened or by the seasons affecting the surface water. We think this difficulty can be overcome without uselessly expending power.

The above is given as a summary of the relative advantages of the two systems of mine pumping, for a part of which we have to rely upon memory, but we are substantially correct.

Chlorination at Mount Morgan, Queensland.

At the new West Works, which treats 100,000 tons per annum, the low grade gold ores are extracted with a previously prepared solution of chlorine in water, and are not gassed as in ordinary methods. In "Proceedings of the Institute of Civil Engineers," E. W. Nardin describes the plant, which consists of sixteen vats of 100 tons capacity each, four chlorine stills, four towers, four solution tanks, four gold liquor tanks, twelve charcoal filters, three vacuum pumps, three force pumps, and one driving engine. The chlorine is made from salt, manganese dioxide, and sulphuric acid, manufactured at the company's works from imported sulphur. The gas from the stills is dissolved in water trickling over pieces of glass, with which the towers are filled. The solution runs into the storage tanks, which are covered in at the top and worked by pipes and valves in the base operated from above. The vats have a wooden perforated false bottom and layers of gravel and sand of diminishing size are laid upon it. The internal dimensions are 60x12½ feet with a depth between 5 feet at one end and 5½ feet at the other; 1½ feet of the depth is occupied by the prepared gravel bed. The ore is thrown in on this bed and the chlorine solution run in over it. The gold liquor is drawn through and out from below by a small vacuum of five pounds per square inch, and passed on to the storage tanks. Fresh chlorine solution is run in until the exit liquor contains plenty of free chlorine, when the ore is washed through with water. The gold is precipitated by passing the liquor through a 2-foot bed of crushed charcoal lying on a cloth on the wooden perforated false bottoms of the filtering vats, the charcoal being afterwards burnt and the ashes smelted for the metal. The cost worked out during one month at \$1.0645 per ton, with ore of the average assay of 11 dwts. 13 grains. The residue contained 22 grains, showing an extraction of 92.06%, the quan-

tity of ore treated being 9852 tons. The cost of the chlorine was 11.85 cents per pound, and the weight used per ton of ore was 2.51 pounds, the time under solution being thirty-three hours, and under water thirty-five hours. The average weight of chlorine per cubic foot of solution was 620 grains, and the still efficiency 72.59%. The richer sulphide ores, containing about four ounces of gold per ton, at the top works are, after roasting, treated by the same process, and show an extraction of 95% with a consumption of 11.47 pounds of chlorine per ton of ore. A new plant to treat 2000 tons of low grade sulphide ore per month is nearing completion.

Cyaniding Rock in Place.

"A little nonsense now and then
Is relished by the wisest men."

We are working a quartz ledge in the Salmon mountains of Siskiyou county, California, and our postoffice is Callahans, 50 miles from the mine. For obvious reasons, it will be understood why I do not locate the claim definitely. "There is me, and the cook, and the Portugee bold," to say nothing of Quo Vadis the mule, Cyranio the dog, and Taddles the cat. The snow is 10 feet deep on the level, and the new century is here. The Portugee is bewailing his fate: "Notra dam turk', notra dam Tom an' Jer', notra dam ting 'cept ham an' bac', an' snow, an' work-work-work!" He is too lazy to showshoe it out, and moreover, as we have but embryo bullock, which he declares to be bogus, and will have none of, what can we do toward paying him off? Neither old Joe nor I believe Manuel desires to leave. We have fired him several times during the past five years, paying him in coin of these U. S., or in I. O. U.'s, as the case might be, and after a howling week of jag at the nearest camp the Portugee, accompanied by R. E. Morse, has found himself again under our vine and fig tree (i. e., tunnel and shake roof), begging for "one dose de good-a bromo."

But I digress. This is the story of a new (?) process in gold mining, not the incidents of a Portugee's periodicals.

The snow is so deep, the wind so painfully mournful through the pines; there is such a lack of congeniality between men shut up in a cabin that I'm garrulous, even on paper.

Two years ago we found the Pizen Dog claim while digging a water hole above a spring. It did not crop, and the foot of quartz between diorite walls panned a good string of flour gold, so fine that it floated when the water was off the prospect for a moment, but it was good to look upon—a hundred-dollar prospect. We covered it, blazed some trees in a circle around the hole, and kept on our weary march northward, for we had the genuine and only Simon Pure map and description of the Lost Cabin claim, dated A. D. 1855, which Manuel's grandfather upon his deathbed had bequeathed to us while in Mexico—"but that's another story"—and the translation gave the most minute details; so we were sure of finding the diggings. Let me state here in parenthesis that the Lost Cabin placer mine, upon the headwaters of the Trinity river, was worked by two Portugees in the early fifties, and they took out all they could stagger under. One died with D. T. in San Francisco, the other was shanghaied. Manuel's grandfather's brother returned to Mexico broken in health, but the priest took his description of the mine and we have the original document.

You will say it was another "lost mine." It was, but we found it!—found it without the slightest trouble, and it paid as high as fifty ounces per day per man. Not to us—no such luck—but to some fortunate miners who stumbled upon it in the sixties and who worked out the little draw.

We had come 2000 miles and were flat broke, so while old Joe opened a set of books for a store, and Manuel dealt monte and hokey-pokey, I ran an arrastra for a farmer. In two months we had a stake to take us back to the Pizen Dog of the Salmon river.

The prospect was as we left it. We built a wickiup and started a tunnel to crosscut, that in 70 feet gave us backs of 50 feet upon the ledge which we followed, saving the ore.

We built a small arrastra, and Quo Vadis the mule worked a week, when the mine and gulch went dry—not enough water to drink, and the river two miles distant.

The vein is peculiar in some respects. The cleavage is horizontal and the quartz lies in ribboned layers with vertical minute open oxidized seams that carry the free gold. The matrix is apparently barren and the seam colors so fine that panning must be done under water; strike east and west; dip vertical; walls close, hard diorite.

Summer was upon us, so we cleaned up the arrastra. The yield was generous, for the ore was hand sorted. Manuel was sent for supplies to Cecilville, and old Joe and I began developing the pay chimney. We had 35 feet of drifts upon the ledge, when one morning old Joe threw down his hammer and danced out of the tunnel shouting, "By the shinbone of my paternal ancestor, I have it—Eureka!"

Men living in the mountains get "off" easily, so I held on to my drill and followed him out, trusting I

would not have more than temporary persuasion upon my hands. There he was, hornpiping it, bareheaded, under a sun of 105° F.

Poor old Joe. We have been partners, broke and affluent in several lands for twelve years, but I never saw him other than the staid and taciturn old Heidelberg student of metallurgy. He waved his arms and shouted, "Holy smoke, and we've been trying to amalgamate it! Blockheads! Stoughton Bottles! It's morogonous!"

"You see," he yelled, "2 Au plus 4 KCy plus O plus H₂O equals 2 Au KCy₂ plus 2 KOH, and that's a lovely equation!"

"Come along, old man, that's a good fellow." He was worse than I feared, babbling chemistry synonyms, and if Manuel had been there we could have strapped him down till the first flush of delirium was over.

Again he shouted, "But 2 KAu Cy₂ plus Zn, me bucco Ananias, yields K₂ Zn Cy₂ plus 2 Au—wow! And she's dry as a bone—percolation perfect!" Again he gave a warwhoop and waved his arms.

"Look here," I yelled, shaking him by the arm, "you come along with me and take a good dose of Manuel's bromo, and a sleep, and you'll—"

"What t'ell's matter with you? I've got it, I tell you—got it pat—the Pegleg and the Lost Cabin will be nothing to the case of purging the Pizen Dog. We'll give him the gold cure!" and he ambled again.

I sat in the shade and wiped my forehead. I think I wept a little. I was sick all over, but old Joe noticed my agitation and came to me.

"Just let me think it out," he said. "It's here, back in the gray matter all right, and bound to come in time. Resurgam!"

I lighted my pipe, but I never dropped the 2-foot drill. I sweat cold all over, but his next remarks sent me to my feet. "She is dry, isn't she? And the gold is free in the seams? We have 50 feet of backs, and 35 feet blocked out, say 125 tons at \$100, equals \$12,500. Now, why not pour on a cyanide solution, catch it in the drift, drain it into a vat, and precipitate it upon zinc shavings? It will work for us while we sleep, and it is worth trying."

We did no further physical work that day, but the strain upon our mental caliber was tense, and the pro and con resulted in my leaving for Cecilville to round up the mule and Manuel. The latter I alternately kicked and ducked into sobriety, for he was "loaded for bear," and the former I saddled and headed for the railroad 75 miles distant.

Old Joe and Manuel dug a trench along the surface of the shoot over the drift, made a set of receiving tanks, a pump, boxes for the zinc, and built a snug log cabin.

In three weeks I returned. The sample sent to the city assayed \$198.75 per ton, and by laboratory test 96½% was saved by the cyanide process. The cyanide, zinc, acids, treatises and grub were carefully packed in by Quo Vadis, and I was footsore and weary, but the first remark of old Joe tired me more: "Did you find how much royalty we have to pay to the patentees?" I had not, so we let it go at that and set to work.

With a makeshift plow we dug a small ditch 2½ miles long, and in five weeks had a trickle of water on the claim. We then carried a strong solution into the adit and held our breaths. Nothing percolated. The tunnel was as dry as a bone. We took turns and watched all night, and the drifts were, if anything, drier than ever. More solution, more examining, more wondering. We kept a steady flow into the adit, which absorbed it readily enough, and upon the third day the roof became wet in patches, then the drip came. We carried it in a trough to the mouth of the tunnel and into the zinc boxes. The trick was done, and the brown residue, slimy and uninteresting, was dried and carefully saved. Manuel was more excited than either of us, and his disgust upon seeing what we called gold was painful.

We worked for a month and then came on heavy rains, and cold weather followed fast. We made an upraise of 10 feet into the ledge, and apparently there is as much gold as before, in the seams, not acted upon by the solution, though the weight of our residue assures us that we have a generous return for our summer's work, and old Joe suggests renaming the mine the Widow's Cruet. Next spring we will attempt a totally new scheme for working the ledge and for saving values, and our dead work will be complete by the time the snow is off.

A CALIFORNIA MINER.

Callahans, Siskiyou Co., Cal., Jan. 15, 1901.

WOVEN WIRE GAUZE AND CLOTH is now made with meshes so infinitesimal as to number 40,000 of the latter to a single square inch. The more delicate classes of wire—those which stand related to scientific instruments—are of such fineness as to render their measurement a matter of difficulty; this task, however, has been made practicable, and platinum wire has been drawn 7000 of an inch and to even greater fineness. Aluminum wire, too, has been drawn as fine as 10,500 yards to the ounce, a size too fine to be measured practically by any gauge or instrument. Iron has also been so attenuated that over 2½ miles in length weighed only one ounce; a more remarkable instance of this class of mechanical manipulation is the drawing of twenty-four grains of gold on a silver wire to 120 miles.

The Mines of Esmeralda County, Nevada.*

Written for the MINING AND SCIENTIFIC PRESS by
H. W. TURNER, U. S. Geological Survey.

In the county of Esmeralda, Nevada, ore deposits are known at a great number of points which, in a region better supplied with water, fuel and cheap transportation, would now be worked. It is only the high grade of ores that are reduced; nevertheless, with the improvements in methods of reduction and the gradual cheapening of mine supplies, it is not improbable that lower grade deposits can be handled at a profit on a large scale in the future. The northern part of Esmeralda county is traversed by the Carson & Colorado Railroad and is thus accessible.

As evidence that this section is entitled to some attention from the mining public, the following table of the production of the mines of the county is introduced:

Yield of Esmeralda county, Nevada, from 1880 to 1898, by Chas. G. Yale, from reports of Director of U. S. Mint:

Year—	Gold.	Silver,†	Total.
1880.....	\$953	\$1,282,800	\$1,231,753
1881.....	35,000	1,620,000	1,655,000
1882.....	50,000	1,470,000	1,520,000
1883.....	60,000	890,000	950,000
1884.....	75,000	500,000	575,000
1885.....	150,000	853,000	1,003,000
1886.....	103,300	619,400	722,700
1887.....	100,000	562,500	662,500
1888.....	192,933	555,289	748,222
1889.....	152,000	398,000	550,000
1890.....	110,000	350,000	460,000
1891.....	164,000	371,000	535,000
1892.....	60,000	80,000	140,000
1893.....	50,000	20,000	70,000
1894.....	82,000	3,000	85,000
1895.....	177,174	5,948	183,122
1896.....	280,054	13,000	300,054
1897.....	142,588	4,280	146,868
1898.....	108,099	3,040	111,139

Total.....\$11,649,358

† Silver is given in coining value.

There are no complete records of the production previous to 1880, but in the reports of the United States Commissioner of Mines and Mining there is a partial statement for the years 1870 to 1873 and 1876, giving a total of \$1,743,268 for those years.

According to S. A. Knapp, a mining engineer, long resident in the county, the total production of Aurora is said to be about \$16,000,000 and that of Candelaria \$15,000,000, most of which was produced previous to 1880. It is thus evident that the total production, if these figures have any value, is far in excess of the recorded amount, which is as follows:

1870—1873 and 1876.....	\$1,743,268
1880—1898, inclusive.....	11,649,358
Total.....	\$13,392,626

Moreover, the reported production of the Silver Peak, Palmetto, Pine Grove and other mines before 1880 amounts to several millions. It is not improbable, therefore, that the total production of the county is over \$40,000,000.

GOLD AND SILVER.—Up to the present time the main metal product has been almost entirely the precious metals. Perhaps the most notable camp in the county is Aurora, where there are strong ledges which were worked in early days only to a limited depth. The excess of water is said to have prevented deep mining at a profit, but there appears to be a field for the application of modern methods. As before stated, the reported production of Aurora is about \$16,000,000.

Next in importance is Candelaria, the production of which is mostly silver, estimated at about \$15,000,000. According to the census of 1880, the ore contained horn silver, malachite, galena, tetrahedrite and other minerals. The mine is located on the steep north slope of a ridge, which is capped with basalt. The strongest quartz lode is known as the Holmes vein, which dips northeast at an angle of about 45°. The hanging wall is serpentine and the foot wall siliceous slate and quartzite. There is said to be good ore still in the Candelaria mines, but they are not now being worked. Near Candelaria, Wm. Grozenger is exploiting a silver vein, and there are also other properties in this neighborhood.

The mines in the vicinity of Silver Peak lie chiefly in an east spur of the Silver Peak Range, known as Mineral Ridge. This ridge is composed of a complex of granite, gneiss and schist, on which lies a Lower Cambrian series of rocks composed of dolomite, limestone and green Olenellus slate. The quartz veins lie in this complex, usually within a few feet of the overlying dolomite. The veins dip with the schistosity of the complex usually at an angle of less than 45°, 20° to 25° being common dip. At many points there are dioritic dikes along the veins, and these, at some points, cut the veins, indicating their later age. Practically none of the mines of Mineral Ridge have been worked in depth. There is every evidence that some of the veins extend down far below the present workings. On account of the expense of wood and water, the ores below \$10 per ton can not be profit-

ably worked except on a large scale. Water can be piped from the Inyo mountains, and plenty of salt water suitable for milling can be obtained from wells in the Clayton valley. If the coal seams, at the north end of the Silver Peak Range, hereafter noted, prove to be as extensive as seems probable, plenty of cheap fuel will be available.

The famous and much sampled mines of the Silver Peak Mining Company are chiefly free-milling gold ores, and the quartz veins are large, one of them being opened up by surface cuts and inclines for nearly a mile. The concentrates, consisting of pyrite and galena, are valuable. The total product of the mines of the Silver Peak Mining Company is in excess of \$1,000,000, but the exact figures are not at hand.

The Mary mine, belonging to John Chiatovich, has been producing for a number of years. Only ore averaging over \$10 per ton is taken out. This is milled at Silver Peak, the tailings being treated by the cyanide process.

The Homestake mine—now called Elizabeth—has also been productive.

The Great Gulch, owned by G. W. Leidy, lies about midway between the main mines of the Silver Peak Mining Company and the village of Silver Peak. This vein is said to show an average value of about \$20 per ton. At one point it contains a considerable body of arsenopyrite, which carries values.

In addition, there are many claims on the top of Mineral Ridge showing strong veins of quartz, among which may be mentioned the Eagle, Missouri, Crescent and some claims owned by the Valcalda brothers.

Another mineralized district is at the north base of the Palmetto mountains, which lie just south of Clayton valley, in which Silver Peak village is situated. There are here a number of low-grade quartz veins and one silver-lead lode—the Mammoth—the concentrated galena of which shows a value of about \$40 per ton. As there are numerous springs and an abundance of firewood, mining could here be carried on cheaply. On the south side of the Palmetto mountains, at Palmetto and Lida valley, veins have also been worked, but these properties were not visited. There are also silver-lead deposits at Sylvania, and Louis Chiatovich is working at a profit a vein near Gold mountain, in the extreme south end of the county.

The Montezuma district, lying east of Clayton valley, is said to have produced lead-silver ore to the value of \$200,000. Northeast of Montezuma is South Klondyke. This camp can be reached from Silver Peak in a day's drive. This recent discovery is due to J. G. Court, one of the present owners. The quartz vein is a strong one, striking northeasterly and dipping to the southeast at an angle of about 40°. The ore is chiefly chloride and sulphide of silver and galena, and occurs in pockets and small ore chutes, the largest one thus far developed being perhaps 40 feet long. About sixty tons of high-grade ore have thus far been shipped to the smelter. This had a gross value of over \$280 per ton. The South Klondyke quartz vein lies in slates, which are intruded by a dike of muscovite-granite. This dike follows the course of the vein and lies a few feet below in the foot wall country rock. Doubtless, the vein owes its origin to this intrusion. The slates are also intruded by white rhyolite dikes, but these probably are of later age than the vein. A short distance south of Klondyke is a quartz vein containing gold and silver, and in the gulch below this vein about \$2000 in coarse gold was recently washed out of the loose material by Mr. Turner of Silver Peak. There are also other quartz veins now being prospected in the vicinity. The South Klondyke Camp is supplied with good ore from a well 150 feet deep in the valley to the southwest.

Lying about 10 miles nearly due north of South Klondyke is the new camp called Tonopah, at an elevation of over 6000 feet. This may be reached from Silver Peak or from Sodaville on the Carson & Colorado Railroad. The latter route possesses the advantage of having water at two points—Summit Springs and Crow Springs. The distance from Sodaville to Tonopah is, approximately, 60 miles. The veins at Tonopah were discovered in 1900. There are several of these veins from 1 to 10 feet in depth, with an approximately east and west course and with a vertical dip so far as developed. The ore contains more silver than gold and varies a good deal in value, but considerable portions of the vein average upwards of \$60 in value, with occasional chutes of very high-grade ore. The country rock is white porphyry (rhyolite). Water is obtained from Tonopah Spring, about 3 miles distant. There is no wood in the neighborhood. Fig. 1 gives an idea of the nature of the region about the camp. The cost of mining, sorting, transporting and reducing the ore is said to approximate \$50 per ton at the present time.

A silver-lead deposit is being worked in the Monte Cristo mountains, northeast of the Columbus Marsh, by Gilbert & Thompson.

The Indian Queen mine, at the north end of the White mountains, near the California line, has altogether produced a considerable amount of the precious metals. This property was not visited.

In the Silver Star mining district, about Sodaville, ore deposits have been found at many points. The most notable camp is Douglass, about 8 miles by the road west of Sodaville. According to W. J. Douglass,

the gold veins were discovered in 1894, since which over \$300,000 have been produced. The ore milled averages \$25 per ton. Mr. Douglass states that the veins have an east-west trend and dip to the south.

North and northeast of Luning, in the Gillis Range, and elsewhere, veins were formerly worked. In the Hawthorne district, in the range southeast of Hawthorne, are the Pamlico, La Panta and other mines. The La Panta was visited by H. R. Johnson, who reports that the ore occurs in chambers usually at the contact of an intruded sheet of quartz-porphry with the enclosing limestone. The chambers are irregular and from a few inches to 10 feet in diameter. There are dark dioritic dikes cutting limestone or dolomite near the mines. S. A. Knapp gives the production of La Panta mine as \$260,000 and the Pamlico as \$150,000. The Big Indian mine, in the Wassuck Range, southeast of Hawthorne, is said to have produced \$100,000, chiefly gold. In the northern part of Esmeralda county, at Pine Grove and elsewhere, there are mines which were worked many years ago. Some of these properties are still producing. The total product at Pine Grove has been several millions.

COPPER.—There are deposits of copper at many points in the county, but very little has thus far been produced. Copper is found in the range northwest of Sodaville, one of the mines being owned by Robert Stewart, who recently shipped fifteen tons of ore containing 27% copper and ten ounces silver to the ton. According to the report of the Director of the Mint for 1883, there was reduced from the ore of the Blue Light copper mine, in the Silver Star district, 128 tons ingot copper, the ore averaging 25%.

The Vulcan Mining & Smelting Co. has been vigorously exploiting a copper lode about 5 miles east of Luning. An account of this property may be found in the MINING AND SCIENTIFIC PRESS of Oct. 6, 1900, written by E. McCormick. The ore now obtained is chiefly carbonate, with some sulphide. It occurs in dolomite along the contact of an intrusion of quartz-diorite-porphry.

The Pacific copper mine lies on the north slope of the Pilot mountains, east of Sodaville, at an altitude of about 8000 feet, and the lode is a bed of dark chert 600 feet or more in width and of much greater longitudinal extent. This chert bed has been thoroughly shattered and broken up along a dike of a light colored dioritic rock. The copper-bearing solutions have penetrated the shattered portions of the chert bed and deposited the ore, which is chiefly cuprite or red oxide of copper. The weathered outcrops of the chert layers are of a dark rusty color and show, as a rule, no traces of copper oxide or carbonate on the weathered surfaces. It is only when the rock is broken that its valuable nature is made apparent. This ore is said to average several per cent of copper, part of it being high grade. S. A. Knapp, one of the owners, is confident this brecciated chert ore can be concentrated. Fig. 2 gives an idea of the size of the croppings. In one of the tunnels a considerable amount of native copper occurs, and the water running from this tunnel deposits a rusty iron precipitate. It is used for domestic purposes. The water issuing from another tunnel close by forms a green copper precipitate as it runs down the gulch. There is an abundance of wood in the neighborhood and strong springs. As there are upwards of 400,000 tons of this ore in sight, the mine undoubtedly has a commercial value.

An undeveloped copper lode, showing near the surface carbonate and sulphide of copper, lies in Section 31, Township 4 N., Range 31 E., near Huntton valley, in the western part of the county. This is the property of J. G. Booker of Hawthorne.

COAL.—At the north base of the Silver Peak Range there are Miocene sandstones and shales which contain coal seams in places 10 feet thick. An account of this coal field was published in the MINING AND SCIENTIFIC PRESS, Vol. 77, 1898, p. 488, by M. A. Knapp. The beds containing the coal are lake deposits. Joseph Sigel of Chicago is now engaged in boring in the lake beds to the northeast of the known croppings of the coal seams, to determine the quantity of coal. The results of Mr. Sigel's exploitation may be looked forward to with interest. The coal seams undoubtedly underlie several sections in this vicinity.

BORAX.—For many years borax has been obtained from several of the salt marshes of Esmeralda county. The total production has been large. It has come chiefly from Rhodes' Marsh, Teal's Marsh and the marshes of Columbus and Fish Lake valleys. The work of collecting the borax salts is done chiefly by Chinese and Indians. At present the industry is being carried on at Rhodes' Marsh, Columbus and Fish Lake marshes. The marsh in Clayton valley, east of Silver Peak, shown in Fig. 3, is partly covered with a dazzling white efflorescence of chloride of sodium, or table salt. It is sufficiently pure to be used for domestic purposes.

ARTESIAN WATER.—No artesian wells have, so far as I know, ever been bored in Esmeralda county, with the sole exception of one in Fish Lake valley on the ranch of John Chiatovich. This boring is said to be 500 feet deep, the bottom of the bore being in clay. The water-bearing stratum was not penetrated, but if the well is sunk below the clay, water may be ex-

* See engravings front page.

pected. Undoubtedly, artesian water can be obtained in many of the valleys if the wells are properly located, and the determination of the areas where artesian water can be obtained would be a matter of great importance to the county; however, water comparatively near the surface certainly exists in most of the valleys.

Mining and Metallurgical Patents.

Patents Issued January 22, 1901.

Written for the MINING AND SCIENTIFIC PRESS.

TRAMWAY TERMINAL.—No. 666,267; C. T. Finlayson, Denver, Colo., assignor to the A. Leschen & Sons Rope Co., St. Louis, Mo.

In wire rope tramway terminals having bucket and clip releasing station, loading dumping station, combination with traction rope, clips, buckets, of guideway for rope and clip, slideway on guideway, slide mounted on slideway at clip releasing station, provided with levers arranged to operatively grasp incoming bucket, means including incline planes for releasing levers at loading or dumping station, second slide mounted on slideway, also at clip releasing station, provided with dogs arranged to grasp clip, means for releasing clip slide at end of guideway, lever pivoted to clip slide at end, pivoted at opposite end to end of second lever having its opposite end pivoted to bearing attached to terminal frame; third lever pivoted at end to bucket grasping slide, having opposite end curved; curved slot in curved end, lateral extension on second-named lever toward the first-named lever, pin loosely extending through curved slot of third end of third lever, secured to end of extension of second lever, fourth lever pivotally attached at end to third lever just above its curved end, pivotally attached to second lever opposite extension, means including weight for returning levers and slides to clip releasing stations whereby clip and clip-slide as they move through and along guideway carry the first named lever with them, this first lever moves second, third and fourth levers to impart a positive but slower and retarding movement to said bucket slide and the buckets from clip releasing station to loading or dumping station.

WELL DRILLING MACHINE.—No. 666,478; J. J. Koger, Mooresburg, Tenn.

Combination with drill, upright having pulley blocks, windlass and rope connections between windlass, pulley blocks and drill, horizontally rotatable wheel having radiating spokes, blocks mounted on

under surface of spokes adjacent to outer ends, horizontally disposed guard piece having upturned end, underneath which guard projecting ends of spokes are adapted to pass, bar pivoted at one end to frame of machine, connections between bar and drill-actuating connections, anti-friction roller at free end of pivoted bar, in path of blocks, adapted to be struck thereby, as each block contacts with roller, whereby drill is raised.

REGENERATIVE RETORT HEATING FURNACE.—No. 666,390; C. F. Neureuther, Peru, Ill.

A retort heating regenerative furnace having combustion chamber, vertical wall extending upwardly dividing it into two compartments serving with outer walls to support tiers of retorts, regenerators communicating with compartments of combustion chamber, each having port entering base of compartment on one side of division wall extending upwardly within such division wall, opening at different heights into compartments.

ROTARY FURNACE.—No. 666,517; C. Groll, Roubaix, France.

Stationary annular casing forming air chamber, having air inlet provided with open top, air outlet upon inner periphery at top, stationary cover extending over top of casing, projecting inwardly beyond, cover consisting of substantially horizontal lower section, refractory upper section, rotary grate having portion projected into proximity of lower section of cover adjacent to air outlet of casing, air outlet so located as to discharge air directly against meeting edges of grate and cover.

ORE CONCENTRATOR.—No. 666,603; H. H. Cramer, Aspen, Colo.

Ore concentrator comprising series of tables arranged one above the other, each having segmental opening, circular passageway extending nearly entirely around, with transverse opening between ends over segmental opening, inner and outer ribs concentric with passageway, series of circular troughs for tailings concentric with and partly surrounded by

inner ribs, means for conveying tailings from each trough to and on passageway of next lower table, means for tilting several tables and reciprocally rotating all tables in unison.

APPARATUS FOR TREATING ZINC ORES.—No. 666,597; S. G. Bridges, Kansas City, Mo.

Furnace, retort therein, chamber above furnace into which upper end of retort opens, pump on lower level than chamber, pipe leading from chamber having lateral branch connecting it with pump, baffle plates in pipe, water spray in upper part of pipe, trap at lower end of pipe, deflector F over lateral branch to cause any solid matter to fall into trap, closed condensing tank connected with outlet side of pump, settling tank receiving overflow from condensing tank.

BOILER CLEANING DEVICE.—No. 666,408; W. Chesterman, Punxsutawney, Pa.

Boiler cleaner comprising head composed of series of tubular T-sections connected end to end with each other, branch conduits connected to sections alternating with each other on opposite sides of head, branch conduits having their free extremities arranged substantially parallel with head.

THICKENING OR SOLIDIFYING MINERAL OILS.—No. 666,010; H. Helbing and F. W. Passmore, London, England.

Method or process of thickening or solidifying a petroleum oil which consists in treating same with sodium salt of casein in aqueous solution and then hardening by means of formic aldehyde.

PROCESS OF MAKING ZINC SULPHIDE.—No. 666,300; E. Beringer, Charlottenburg, Germany.

A process for formation of sulphide of zinc suitable for manufacture of white paints and for simultaneous formation of rhodanates or sulpho-cyanides, comprising treatment under pressure and at temperature not exceeding 300° F. of carbon bisulphide by ammoniacal solution of zinc oxide, mixture being agitated until reaction is completed.

WASTE gases from the iron ore calcining kilns at Kotterback, in Upper Hungary, owing to the presence of sulphurous acid and mercury vapors, injure the vegetation in the vicinity. In order to obviate this and at the same time to recover the mercury as a by-product, and so reduce the cost of calcination, the waste gases are collected and purified. The kilns are divided into three groups. The gases of each group are conducted through a wooden tower, in which two grates are placed. These are covered with limestone, on which water plays. The gases traverse the tower in the opposite direction to the falling water, and are thus cooled and condensed, the sulphurous anhydride being dissolved and acting on the limestone. The condensed mercury is collected.

In Swedish mines the workmen have their tools sharpened by a special blacksmith, paid not by the number of tools sharpened, but by the number of yards bored by the miners whose implements he has sharpened during the month.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

At Juneau a new tram is going in on the Lucky Chance; Supt. E. O. Smith.

The Chesna M. Co., operating the Chesna group, consisting of thirty-three creek and bench claims in the Chestochena fields, on Copper river, will work them this season.

ARIZONA.

COCHISE COUNTY.

The Grand Central and Contention mines, near Tombstone, are bonded; large pumps will be put in and work begun.

The main shaft on the Copper Crown, near Dragoon, is down 100 feet.

GILA COUNTY.

The Geneva, near Globe, is shipping ore to the smelter at that point; ore is said to average 22% copper.—Work is in progress on the Golden Wonder, south of Oak Springs.—Johnson Bros. & Rane are working property on Mineral creek, 1½ miles southeast of Ray.

E. H. Cook, Supt. United Globe M. Co., at Globe, has resigned; N. S. Berray will succeed him.—The Lost Gulch Copper Co., Manager J. Langley, is pushing work on its property adjoining the Black Warrior.—The Bobby Burns is leased to F. Golding.—Machinery for the Black Copper mines will soon be in, when work will be begun.

The Tonto Basin M. Co. will operate an arrastra on the Single Standard, near Tonto. The ledge on the property runs from 18 inches to 3 feet in width. The ore averages \$26 to the ton.

GRAHAM COUNTY.

Work on the new 500-ton concentrator for the Arizona Copper Co. at Longfellow is progressing.

A strike of rich ore is reported on the Comstock, in Bonanza gulch, 5 miles from Morenci.

MARICOPA COUNTY.

At Phoenix the following companies are incorporated: Majestic Oil Co., capital \$300,000; Merwin M. Co., capital \$100,000; Goodwin Kern County Oil Co., capital \$500,000.

The People's Oil & Mineral Co., capital \$500,000, and the International Oil & Dev. Co., capital \$500,000, are incorporated at Phoenix.

MOHAVE COUNTY.

At Cerbat work on the Alexander, formerly the Rough Ashler, goes on.—Work on the Delafountain at Stockton Hill will begin soon.—A shipment of ore from the C. O. D., near Kingman, was made to San Francisco recently for a test. Should returns prove satisfactory a mill will probably go in.—The Denver M. Co., who have an option on the Samoon, will begin work on the same.—Three shifts are sinking the shaft on the Redemption.

The Redemption, near Chloride, is reported sold to W. D. O'Neil of Pittsburg, Pa., for \$5000.

The mines of the New England & Arizona M. Co. are being put in shape for a continuous run; mill will start up next month.

The Copper Belle at Turquoise is putting up a 60-ton smelter, to be blown in next month.—W. F. Grounds has opened up good ore in his Music mountain mine, near Kingman.—The Mollie Gibson, near Chloride, is shipping ore.—The cyanide plant of the Arizona & New England M. Co. at Pyramid is running.—A mill will go in on the property near the Gold Road, Kingman, recently located by Mrs. L. Shipp and Hart Bros.—The concentrator is in place at the C. O. D.—A mill may go in on the Mocking Bird, near Kingman, operated by Potts & De Nure.

The Sheeptrail mines, near Kingman, are turning out ore for a run in the mill.

YAVAPAI COUNTY.

The Lincoln group, near Jerome Junction, is sold to C. J. George and E. C. Chapman. A 90-foot tunnel is run on the Quien Sabe and a 60-foot shaft sunk on the same. On the Yellow Jacket a 4-foot ledge is opened up in the tunnel. More stamps will be put in.

In Humboldt district the Farley-Kay properties will be worked by a St. Joe, Mo., company. Two tunnels are to be driven; one, 3400 feet long, to tap the ledge at a depth of 900 feet; the other, 1400 feet long, to tap the ledge at a depth of 600 feet.

A group of claims in the Big Bug district near Prescott is reported sold to T. B. Comstock, representing an English company.

Ore from the Queen Bess, near Prescott, is said to run \$80 to the ton.—A compressor and drills are going in on the McCabe at Chaparral.

CALIFORNIA.

ALAMEDA COUNTY.

The salt works extend along the shore of San Francisco bay a distance of 15 miles, and from the bay inland from 1 to 4 miles. The waters of the bay contain about 3% salt. The recovery is accomplished by retaining the water deposited at high tide by means of large vats formed by levees. In the progress of evaporation the water is allowed to run from one vat to another until, from the concentration of the liquid, it is solidified to crystallization strength—about 25%—before being turned into the making vats. The evaporation is wholly solar. The coarse salt is sacked for shipment at the vats. The table salt is produced by process of drying and grinding. The quantity of table salt is dependent principally upon the skillfulness of the operator and the character of the mill. The eight firms of makers and refiners of salt employ at the salt beds 300 men during the season, the mills or refineries aggregating about 150 during the year.

AMADOR COUNTY.

Work on the Fleming, near Jackson, bonded to the Con. Jackson M. Co., will begin shortly.—On the Kirkwood the shaft is down 230 feet. Crosscutting will be done at a depth of 500 feet.—The Peerless shaft, now down over 600 feet, will be sunk to the 1000-foot level.—Work on the Bay State mines, near Plymouth, will soon be started.—The Ivanhoe mill at Plymouth is running on ore from the Shenandoah. Supt. Thornton reports finding a good body of ribbon rock on the 500-foot level at a point 850 feet in from the shaft.—The Bellwether, near Jackson, has reverted to Mrs. Hepburn by default of the Hepburn M. Co. She, with J. A. Morlan of Los Angeles, will operate the property.

The East Central Eureka M. Co., of Sutter Creek, has brought suit against the Central Eureka M. Co., same place, in the Superior Court, at San Francisco, for \$165,000.

BUTTE COUNTY.

At the Cherokee placer mine, at Cherokee, two hydraulic giants are working steadily; thirty men are employed.

CALAVERAS COUNTY.

The stamps and mill from the Thorn will go in on the Denmore, near Parrots Ferry. A cyanide plant will also go in.—An arrastra will go in on the Virginia at Grapevine gulch.—W. D. Riley is working the Golden Nest, on the San Antonio and Indian creek ridge.—Wyllie, Potter & Treat Jr. have begun work on the old Grounder hydraulic claim, on Murray creek, near San Andreas. It is estimated that 1000 carloads of boulders will be removed from the ground.—At Angels a good-sized body of ore is opened up on the 500-foot level of the Angels.—The new chlorination plant at the Lightner is running satisfactorily. Work is in progress on the Gold Cliff of the Utica group.—Good ore is opened up on the 600-foot level of the Demarest.—A good clean-up is reported from the Ozark gravel mine, near Murphys.

Work is begun on the Sunrise, at Railroad Flat; J. L. Lester foreman; mine is unwatered and sinking is in progress; three eight-hour shifts will be put on.

The electric system and machinery for operating the Sheep Ranch mine by electricity are completed.

The Oriole M. Co., Angels, has levied an assessment of 10 cents per share, to run a 300-foot tunnel into the shaft to clear it of water without the use of a pump.—Crosscutting is under way at the Manhattan, Angels, and another shift is put on.—Oil is to be used as fuel at the Crystal-line.

EL DORADO COUNTY.

Twenty-five men are working on the Shaw, near Placerville. A 5-stamp mill is going in. A new hoisting plant is up.

The Ralston G. M. Co. has a permit to mine with hydraulic pressure at Lynchburg.

H. C. Ewing, while piping on his mining claim at Pilot Hill, recently found a nugget worth \$2000.

Ore assaying \$50 to the ton is opened up on the Burnham, near Georgetown; ledge is 8 feet wide at a depth of 100 feet.

GLENN COUNTY.

Two new companies, the Grapevine Coal & Oil Co. and the St. John Dev. Co., are incorporated at Willow.—The Glenn County Oil & Coal Co.'s well, near Willow, is down 273 feet.—The well of the Great Northern Oil Co., same district, is down 400 feet.

INYO COUNTY.

The Defiance mine at Darwin, owned by the Pat Reddy estate, has been bonded to S. B. Milner and C. D. Rooklidge of Salt Lake City for \$100,000.

KERN COUNTY.

The Shasta Oil Co. is putting up a derrick on its No. 3 well on 14, 28-27 at

Bakersfield.—The Gray Gander Oil Co. is drilling on 7, 28-28.—The Chicago Crude Oil Co., operating in the northwest corner of 30, 28-28, has put up three new rigs, and it has three strings of tools operating.—The Standard Oil Co. has completed two large iron tanks and is putting up three more.—Well No. 13 of the Continental Oil Co. at Bakersfield was completed in thirty days.

At the Exposed Treasure, near Mojave, the new plant, capacity fifty tons per day, is nearly completed. The shaft is down 460 feet. The ore runs \$67 to the ton.—On the Karma the shaft is down 280 feet. Four hundred feet of drifting is completed.—Work is in progress on the Mojave group, adjoining the Karma.—Ore running \$180 per ton is opened on the Little Johnnie, an extension of the Mojave group.—It is estimated that the output of the Mojave mines from March 1, 1901, to March 1, 1902, will be more than \$300,000.

At Midway the Transfer Oil Co. is down 300 feet.—New rigs are going up on the property of the Senator Oil Co., Bakersfield.—The Bay City recently struck oil sand at a depth of 570 feet; drilling is going on to the second sand.—The Transcontinental Oil Co., capital \$300,000, is incorporated at Bakersfield.—A project is reported for building a railroad from Bakersfield to Port Harford.—Ludwig & Hickie will begin drilling on Section 17, near Bakersfield.—The well of the Bear Flag, on 31, 28-28, Bakersfield, is down 105 feet, and it is expected to produce 300 barrels of oil per day.—The Linda Vista is down 600 feet.

Operations are resumed on the Little Butte at Randsburg.—The Jenny Lind and Philadelphia quartz mines, at Randsburg, are leased to C. E. Ferris.

LOS ANGELES COUNTY.

The Domestic Oil Co., capital \$50,000, is incorporated at Pasadena.—At Los Angeles the following companies are incorporated: Russian Oil Co., capital \$500,000; Brubaker Oil Co., capital \$450,000.

The B. B. Oil Co., operating on the Brown tract, near Los Angeles, is down 750 feet; it is expected that oil sand will be struck at 1000 feet.—Pitcher & Garbutt are down 750 feet, with 9½-inch hole on their property east of the Pelissier well.—The well of Riley Bros., on Western avenue, Los Angeles, is down 1000 feet.—The Westlake Oil Co. has completed well No. 46, and 47 and 48 are now being pumped; drilling is in progress on Nos. 49 and 50, and a rig is in on No. 51.—The Oceanic Oil Co. will put down six more wells.—The Atlas Crude Oil Co. will drill four wells on its property.—At Sunset Park, the Sunset Park Oil Co. will begin drilling for oil soon.—The Alliance Oil Co., drilling a well near south end of the tunnel, in the Newhall field, is down 700 feet.—No. 1 well of the Regal Oil Co., on the corner of First and Belmont avenue, Los Angeles, is down 850 feet; 15 feet of oil are in the hole.

MONO COUNTY.

In the Standard Consolidated mine at Bodie the stopes in the various ledges yield the usual quantity of ore. At the mill, 375 tons of ore was crushed during the week ending Jan. 19; average assay, vanner tailings, \$7.39; concentrates produced, 1.14 tons; assay value, \$60.57; amalgam produced, 1306 ounces; assay value per ounce, \$2.46.

MONTEREY COUNTY.

The San Antonio Oil Co., drilling at San Ardo, is reported to have oil at a depth of 700 feet.

NEVADA COUNTY.

The Yuba, near Maybert, will be reopened by a San Francisco company; Supt. J. L. Bryson.

Unwatering of the Diamond, near Grass Valley, is under way; hoisting machinery is being put in shape for a run after mine is unwatered; G. Murphy, Supt.

Thomson & Balch of San Francisco are preparing to open up properties near Rough and Ready.—Deasy, Morse & Hawkins Bros. have bonded the Niagara, near Newton.

ORANGE COUNTY.

The Capistrano Oil Co., operating near Capistrano, has shut off water in its well with 9½-inch casing at 650 feet, and has struck quite a seepage of oil at 690 feet.

PLACER COUNTY.

The new electric plant at Turkey Hill drift gravel mine, near Michigan Bluff, has been started and is running the mill and electric locomotive which hauls the cars of gravel from the mine.

RIVERSIDE COUNTY.

The San Jacinto Oil Co. will drill another well near San Jacinto.

SAN DIEGO COUNTY.

The Santa Ysabel Water Co. is pushing work on its tunnel from Santa Ysabel creek to placer mines in Hatfield canyon;

tunnel, now in 300 feet, will be driven an additional 300 feet; a 3-mile ditch will be dug to carry water to the mines.

A number of borax mines were recently located in the McKain district, 30 miles from Julian.

SANTA BARBARA COUNTY.

The Commercial Union Oil Co., operating at Summerland, is down 780 feet.

SHASTA COUNTY.

The Hiatt G. M. Co. has bought the Cleveland gold quartz mine at Quartz hill for \$10,000.

SIERRA COUNTY.

The Telegraph, on Fur Cap, near Downieville, is reported sold to J. W. Finney. The new compressor at the Gold Bluff, at Downieville, is in and runs satisfactorily.

SISKIYOU COUNTY.

Work at the Gold Ball, in Salmon River district, is progressing; usual number of men working.—After a run on ore from the John Joseph, same district, the Fagundas mill is temporarily closed down.—A new tunnel is being driven on the Humback.—Owing to a heavy fall of snow, the Kleaver, in Salmon River district, is closed down; it will soon resume.

High-grade ore is being taken out of the Esmeralda, same district.—Work at the Salmon River gravel mine is going on.

The Siskiyou Hydraulic M. Co., operating on Klamath river, below Happy Camp, has made some good clean-ups.

STANISLAUS COUNTY.

Haslacker & Kahn will bore for oil between Oakdale and Knight's Ferry.

TRINITY COUNTY.

The Sweepstake M. Co. will build a ditch 29 miles long, including an inverted siphon 10,000 feet long, with a capacity of 4000 miner's inches, from Canyon creek to the mines, near Weaver; a bedrock tunnel is being driven; gravel yields 25 cents to the yard.—The 2800-pound wheel on the dredger in Weaver creek, near Weaver, has broken; a new one goes in.

The T. G. P. M. M. S. Ltd., is operating its drift and hydraulic mines at upper Coffee creek.—The Yellow Rose of Texas mines will resume next spring.

At Poker Flat, near Lowden's Ranch, the dredger in charge of Supt. M. Van Meter is running steadily.—A 12-mile ditch and flume is built from the Last Chance to Grass Valley creek.—The La Grange hydraulic mine, near Weaver, is about ready to resume.—Work is in progress at the Chloride, 3 miles above Dedrick; Supt. Ramdohr.—A tunnel is being run on the Red Rose, adjoining the Yellow Rose.

TULARE COUNTY.

A magnesite roasting plant is to be built at Porterville; it consists of a 15 H. P. engine, 25 H. P. boiler, crusher, elevator, oil tanks, pumps, etc.; cost will be between \$5000 and \$10,000 and capacity will be twenty tons of raw magnesite per day. In roasting it will lose 40% of its weight. Twenty tons of the raw will turn out twelve tons of roasted magnesite.

The Porterville M. & M. Co., L. Schwabacher (general manager of the Floriston Pulp & Paper Co. of Floriston) manager, will ship this year's output to Floriston and also to the Crown Paper Mills in Oregon. The furnaces are to be built to burn oil or wood; if former fails, wood will be used. The roasted material will be used, after being pulverized to a fine powder, to take out the resinous matter in the wood pulp used in the manufacture of paper. It is expected that output for this year will be 1200 tons roasted material.

TUOLUMNE COUNTY.

Machinery is going in on the Handover, at Carters. Operations on the Little Beauty will resume soon.—On the Hard Times, Cullers Bros. are sinking a winze 200 feet from the mouth of the tunnel.—At the Confidence, stoping is in progress on the 350 and 560-foot levels; mine is now lighted throughout by electricity.

The low-grade ore on the second level of the Santa Ysabel on the hanging wall of the Boulder vein has been located on the fifth level. It is about 15 feet wide; the values are very low.

The Hamilton G. M. Co., capital \$100,000, recently incorporated; properties near Groveland.

Three machine drills are in operation at the Santa Ysabel, at Stent; drifting south is in progress on the 400-foot level. Electric drills will go in at the High Point, and more men will be put on.

Drifting and crosscutting are under way at the Republican, Sonora.—A company is being organized to work the Blue Lizard and Laguria mines, near Groveland.—Operations on the Harvard, on Whisky hill, near Jamestown, are to begin. A 60-stamp mill is on the property.—Ore being taken out at the Goldwin, near Sonora, runs from \$70 to

\$80 to the ton.—An arrastra is being built on the Ferguson.

YOLO COUNTY.

Work is progressing at the Spenceville, near Wheatland.

YUBA COUNTY.

J. O'Brien has bonded to Hammond, Doollittle & Woolsey 2000 acres of land 9 miles east of Marysville, which they will prospect with a view to installing gold dredgers. The location is considered a continuation of the old Smartsville channel.

A Keystone driller is on the ground at Indian valley, above Camptonville.

COLORADO.

BOULDER COUNTY.

A deal is on for the sale of the Slede, at Gold hill, near Wall Street. If it goes through, new owners will run a crosscut on the 800-foot level.—The Beaufort mill, at Ward, is running steadily on B. & M. ore.—The shaft on the Superior will be sunk to the 1000-foot level.—A track will go in the tunnel of the Nimbus.—On the Porto Rico, at a depth of 25 feet, a streak of ore 8 inches wide is opened up.—The Sunny View and Johanna (patented claims), Ophir Nos. 1, 2 and 3, are sold to Duncan & Wise.—The shaft on the San Blas, now down 600 feet, will be sunk to the 1000-foot level.—Work on the Silver Lake, 4 miles southwest of Ward, is progressing favorably, and will be continued through the winter; shaft, now down 215 feet, will be sunk an additional 100 feet.

CHAFFEE COUNTY.

A new plant is going in on the Lone Star, at Hancock; Manager C. A. Smith.—The smelter at Buena Vista is being enlarged; new blowers and a larger motor are on the ground.

CLEAR CREEK COUNTY.

The Cornucopia Power & Development Co. is organized to work claims near Idaho Springs; a tunnel will be run to cut the Lone Jack at a depth of 1600 feet; machinery and drills will be put in when development allows; A. J. Bean, Supt.—Operations on the Kinda are resumed after a shut-down of several years; Mr. Crawford of Kansas City, Mo., owner.—Work is in progress on the Neptune group, operated by the Osborne M. & M. Co. of Colorado Springs.—The shaft on the Dover, at the mouth of Fall river, now down 200 feet, will be sunk to the 500-foot level.

J. Clayton will put in a new set of pumps on his Russell Gulch property.

CUSTER COUNTY.

A mill to treat low-grade ores will be built near Rosita by J. W. Randall of Fremont, Mich., and W. B. Lacy of Idaho Springs.

The shaft on the Geyser, near Silver Cliff, is in 2670 feet, being the deepest in the State; it is said that the Eastern stockholders will take over the property and develop it.

EL PASO COUNTY.

A strike of rich ore is reported in the tunnel of the Oil Creek M. Co., now being run under Pike's Peak; ore is said to run \$400 to the ton.

GILPIN COUNTY.

Another shift is working at the Sherman, on Silver creek, near Apex.—The following companies are incorporated at Black Hawk: Gregory-Buell Con. G. M. Co., capital \$5,000,000; Grand Central G. M. Co., capital \$1,500,000.—The London, on Academy hill, near Black Hawk, is shipping ore to that point.—A new hoisting plant is going in at the Pochontas, on Dory hill, Black Hawk; Denver men will operate this mine.—Scott, Mee & Co. are working the Golden Flint, at the head of Gamble gulch, southeast of Perigo; lessees will start up the Rollins mill.—Drifting is in progress on the 187 and 255-foot levels of the Woodbury M. Co.'s property near Black Hawk.—In the Illinois Central district, near Black Hawk, two shifts are sinking the Scandia shaft; it is now down 625 feet; drifting is under way on the 550-foot level west of the shaft; Manager Weisbeck.

Good milling ore is being taken out from the 240-foot level of the West Wyandotte, near Russell Gulch.—In Leavenworth gulch, near Black Hawk, three 8-hour shifts are sinking the West Calhoun shaft, which is now down 210 feet; Manager Tully.—McLeod & Co., leasing on the Kemp-Calhoun, in Leavenworth gulch, are taking out ore from the 230-foot level.—At Russell Gulch stoping is under way in the 300 and 400-foot levels of the Minnesota.—Two 100 H. P. boilers are going in on the Buell, of the Gregory-Buell Con. M. & M. Co. at Black Hawk.—The Chicago-Carr M. Co. is putting in new machinery near Black Hawk.—A 4x12 high-pressure Jeanesville pump is being put in by the Gower M. Syndicate, Ltd., on the Montgomery, Black Hawk; it will go in on the 500-foot level

temporarily, but will probably soon be placed permanently on the 800-foot level; shaft, now down 522 feet, will go an additional 200 or 300 feet.

GUNNISON COUNTY.

The Colorado Smelting & Refining Co., capital \$5,000,000, is incorporated in New Jersey, to work 3000 acres mineral land near Pitkin.

Lessees of the Lead King, at Crystal, are saving ore for shipment in the spring, packing charges being too high at present to warrant shipments being made.

HUERFANO COUNTY.

The recent strike of a 19-foot vein of coal near Walsenburg shows 13 feet of solid coal, the remaining 6 feet being a mixture of slate and coal.

LAKE COUNTY.

H. W. Hinckley has taken a new lease on the Humboldt mine, on Iron hill.

The R. A. M. ships 150 to 200 tons per day of silver-lead ore from the workings at 1065 feet depth. This is a part of the Small Hopes group. M. B. Snyder is foreman.

The Bon Air shaft is the mine farthest southwest of the Home group. It is 535 feet deep and is equipped with steam hoisting and pumping facilities. The workings penetrate the lime formation north, northeast, east and southeast from the shaft on the 500 and 535-foot levels, through crosscuts and drifts, with chutes and upraises from one level to the other in numerous places. On the two levels there approximates 3 miles of work, much of it being dead work performed in prospecting for ore, the latter existing in gash veins, kidneys, chimneys and blankets within and surrounded by the dolomite lime. The workings disclose, however, that these bodies of ore lie within the limits of a horizontal zone which ranges from 20 to 40 feet thick. That is, so far as exploitation goes, the ore seams do not extend much above the upper, or 500-foot level, or much below the lower, or 535-foot. Future work, however, may alter this theory. In places the ore stands almost in a vertical seam, then flattens and widens into an immense blanket. Again, there are shoots of ore which take freaks and turns of all kinds. A body of this is found by driving through the lime; it is worked out and found to have no connection with any other similar body or gash. For this reason the work on these two levels could not conform to any system, but is interesting on account of its complications. The ore consists, in the main, of oxidized iron, carrying silver ranging in value from ten ounces to thirty ounces to the ton; here and there are streaks of lead carbonates, and in one place I saw fine specimens of chloride of silver. The shipments herefrom amount to nearly 100 tons per day. On the 535 level a drift is being driven 1200 feet northward to connect with the Star or center shaft of the Home group. About half this distance has been driven. Leadville, Jan. 27.

The daily output of the Home M. Co., Leadville, is about 500 tons ore, of which 350 tons are from the Penrose, 125 tons from the Bon Air, and 25 from the Star.—The Mayr M. Co. is organized to work the White Cap.—Sinking on No. 2 shaft of the Resurrection is suspended owing to influx of water recently struck at a depth of 750 feet.—The shaft on the Maple Street is down 320 feet.—The St. Louis tunnel is leased to G. W. Lancaster; men are working.—The Boston Gold-Copper smelter has two furnaces running, and a third is being put in shape to run.

Supt. Kleckner is running an upraise in the Hummer, at Leadville.—Sulphide ore was recently opened up in the Hap-hazard, in Lake Park; a shipment of ore will be made to the Boston Gold-Copper smelter.—The shaft on the Butcher Boy, on East Bald mountain, near Leadville, now down 250 feet, will be sunk to the 400-foot level; manager, T. Connors.—The Sedalia is shipping twenty tons of ore per day, running \$25 to the ton.

ROUTT COUNTY.

An explosion of natural gas in the well of the Northwestern Oil & Coal Co., operating near Steamboat Springs, set fire to the derrick and surface buildings, completely destroying them; they will be rebuilt and drilling resumed.

SAN JUAN COUNTY.

The Pride of the West, at Silverton, owned by Denison, Smith and others, will have new hoisting and concentrating plants.

SAN MIGUEL COUNTY.

The new 2000 H. P. power plant of the Telluride Power Co., at Telluride, is reaching completion.—The Smuggler-Union mill is being overhauled. Ten new stamps will be added, making a total of sixty stamps, with a crushing capacity of about 400 tons of ore daily.—The 3000-foot Pennsylvania tunnel is completed; it is connected with the mill

by a new Bleichert tramway.—Recent gold retorts from the Tom Boy weighed between 700 and 800 ounces, an average shipment; monthly output runs about \$50,000; it is said that present milling capacity will be doubled.

The Palmyra group, in Turkey Creek district, will be opened at a lower level than the present workings by a 1000-foot crosscut tunnel; Manager J. H. Shockley.

A new main cable is in on the 2-mile tramway of the Liberty Bell.—Operations on the Nellie group, of the North American Exploration Co., Manager Field, will be started up soon.—The Ophir Con. M. Co., capital \$3,500,000, is incorporated; a new tramway will go in this spring.

SUMMIT COUNTY.

At Breckenridge the new 7x7-foot tunnel of the new Gold Run M. & M. Co., now in over 200 feet, will be driven 3000 feet.

Work on the Jessie group is progressing; the 40-stamp mill will daily treat 100 tons of ore; Manager W. L. Wilson.

A winze will be sunk at the 1200-foot mark in the tunnel of the Jumbo.—Foote and others, operating the Mountain Pride, have lowered water in shaft to a point below where they contemplate working.—Margarophyllite, said to be worth from \$250 to \$1200 per ton, is reported opened up in the Germania by lessees Smith & Boyd.—A cyanide department is added to the 20-stamp mill on the Cashier; plant is lighted by electricity.—Ore from the Carpenter placer patent, on Nigger Hill, is said to run two ounces to the ton.

TELLER COUNTY.

During 1900 the Vindicator, at Cripple Creek, produced 36,809 tons of ore, yielding gross value of \$875,445; the company is deepening its main shaft.—The shaft on the Columbia, now down 340 feet, will be sunk to the 400-foot level.—On the Kentucky Belle a level is being run at a depth of 125 feet.—A strike is reported on the Golden Dale.—Griswold & Meyers, operating the Guess, have sunk a winze 175 feet below tunnel level, giving a depth of 500 feet below surface. A 20 H. P. gasoline hoist is in over the winze.—The Waverly G. M. Co. has begun operations on the Pegleg, on Gold Hill; the shaft is down 200 feet. A new shaft-house was recently built and a 25 H. P. boiler and an 8x10-foot hoist are in.—The output of the Legal Tender, of the Golden Cycle Co., is 100 tons per day. A 3-foot vein of sylvanite ore is opened in the bottom level (700 feet); new machinery is in.—The Lillie shaft, now down 1300 feet, will be sunk to the 1500-foot level. About three carloads of good grade ore from the 800-foot level are being shipped weekly.—The Grace G. M. Co. is moving its shaft-house and machinery from its Raven Hill property to the Extra.—The Leon, survey No. 10,751, is sold to the Leon Con. M. Co. for \$10,000.—A new fifteen-drill compressor is going in at the Vindicator.—C. E. Brady, leasing the Russell block of the Hull City placer, at Victor, recently shipped sixty tons of ore worth \$3450.—Three thousand pounds of ore running about 75 cents to the pound were recently shipped by C. Berg and associates from block No. 2 of the Deadwood; ore was taken from the shoot opened up about six weeks ago on the 570-foot level.—On the 300-foot level of the Wacu Weta, on the west side of Bull Hill, operated by the Fraternal Leasing Co., ore of a good grade is opened up.

The Four Brothers, on Beacon hill, is sold to the Agnes Co. for \$55,000.—Ore from the Little Diamond, of the Big Four M. Co., recently returned two ounces gold to the ton.

Work on the Diamond R., at Cripple Creek, will begin soon; property comprises seventy acres lands.—Maynard & Co., who have the lease from the 500-foot level up to the 400-foot level and from the 300-foot level up to the surface on the Moon-Anchor are pushing work on same, and are shipping screenings to the sampler running seven ounces gold to the ton.

Symes, Delaney & Sims, leasing block No. 3 of the Deadwood, recently shipped ten tons of ore that ran \$83.50 to the ton; ore was from a shoot recently opened up on the 170-foot level.

The Triumph G. M. Co., capital \$1,500,000, is incorporated at Cripple Creek, to work the Triumph, on Battle mountain, and other claims on Squaw, Raven and Tenderfoot hills.

Six feet of high-grade smelting ore are reported opened up on 350-foot level of the Zoe, at Cripple Creek.—The property of the Eleanor Co., on Galena hill, is leased to Sheets & Co. of Colorado City; work is in progress; a shaft will be sunk.

IDAHO.

ADA COUNTY.

The Powder River M. Co., capital \$250,000, is incorporated at Boise.

BLAINE COUNTY.

The Elk M. & M. Co., of Milwaukee,

Wis., has bought the Champlain, Alabama, Hattie and Annie Black claims, on the Hailey Gold Belt, from J. and E. Van Guilder, for \$15,000.

The shaft on the Golden Star, at Hailey, is down 400 feet, and drifting is in progress on that level.

IDAHO COUNTY.

The Blue Jacket, between Goff and White Bird, is being worked by Finch & Campbell; fifteen men are employed.—Drifting is in progress on the Samson group, of the Samson Group M. & M. Co.

The Blue Jacket (copper-gold) at Whitebird is running. Fifteen men are employed.

LATAH COUNTY.

Taylor Brothers are working two shifts driving a tunnel on the Mother Lode, near Moscow; work on the road to White Pine is suspended owing to deep snow.—Moore & Armstrong, operating the Linsley property, are pushing work.—E. Mason will put in a pump on his property near Garfield, and will resume sinking.—J. K. Truax and C. Marsh have completed their flume.—Piping is going in on the Richard Price (placer).—The 11-mile flume on the Mascot Hydraulic Co.'s claims will be completed this month.—The Bucyrus Dredge Co. is preparing for spring work.—The Chickisaw M. & Smelt. Co. will sink its shaft, now down 65 feet, to the 135-foot level. An engine, hoist, pump, two large tanks, buckets, etc., are in.—Brunch & Hutchinson, W. G. Conner and others are getting their placer properties in readiness for spring work.

LEMHI COUNTY.

A strike of \$750 ore is reported on the Comet, 20 miles north of Salmon City.—On the Katie, ore running \$500 to the ton is said to have been opened up recently.

OWYHEE COUNTY.

Irwin, Norton and others have bonded the Trook & Jennings property, on the west side of War Eagle, near Silver City; work will soon begin.

SHOSHONE COUNTY.

The first shipment of copper ore from the Cœur d'Alenes was made some days ago by the Snowstorm M. Co.; ore was taken from the Snowstorm, near Mullan, and was shipped to the Tacoma, Wash., smelter; returns give fifteen ounces silver and 1½% copper; tunnel on the Snowstorm, now in 180 feet, is expected to cut the ore body at the 250-foot mark, giving a depth of 175 feet.

The Bi-Metallic M. Co. has resumed operations on its property, adjoining the Sixteen to One, near Wallace.—The Chloride Queen M. & M. Co. will soon begin operations.—The drift being run by the Stevens Peak M. Co. is in over 800 feet, and a crosscut is being run.

The tunnel on the Leslie group, near Wallace, is in 650 feet, and has secured a depth of 400 feet.—The shaft on the Gold Back (copper), at Murray, is down 46 feet.

MICHIGAN.

GOGEBIC COUNTY.

Over 3000 tons of ore are mined and shipped each day from the Norrie (iron), in the Gogebic range.

MONTANA.

JEFFERSON COUNTY.

The Helper, at Basin, is shipping ore.—W. B. Lyons & Co. are making regular shipments of ore from the Buckeye, in Cataract district, near Basin.—Taylor Bros. are working the Solar, Cataract district.—Ore is being mined at the St. Lawrence for shipment.—Operations on the Sally Belle, in Red Mountain district, are resumed; property is bonded to the Peck Concentrating Co., of East Helena.

MADISON COUNTY.

The Kearsarge, at Summit, recently shipped five tons of ore for a test.—Thompson & Buzzard are sinking a shaft on the Old Townsend, at Summit.—A strike of good ore is reported at the Chile, near Sand Creek; General Manager Browning; capacity of mill may be increased to twenty stamps; shaft will be sunk another 100 feet.—It is locally reported that F. A. Heinze of Butte will operate the Noble.—Work on the new mill going in on the Lake Shore is suspended for the winter.

A strike of rich ore is made at a depth of 300 feet in the Chile, at Sand Creek, 12 miles from Pony.

SILVER BOW COUNTY.

On the 1st inst. the Anaconda Copper M. Co. inaugurated an eight-hour work day system in all its mines at Butte.

NEVADA.

ELKO COUNTY.

On the Hartman & Fordham property, near Sprucemont, good ore is opened up in the winze at a depth of 60 feet.

EUREKA COUNTY.

Johnson Bros., operating the Silver

Connor, on Prospect mountain, near Eureka, are shipping ore from the 500-foot level.

LINCOLN COUNTY.

A new concentrator and 10-stamp mill goes in on the Abe Lincoln group, near Pioche.

LYON COUNTY.

The Boston-Montana Copper Co. of Butte, Mont., are credited with intention to build a 150-ton smelter at Wabaska. The company has bonded the Bluelight, in Mason valley.—A deal is reported on foot for the sale of the Logan & Hullyey, near Como, to an English company. It is estimated that there are 100,000 tons of \$8 ore in sight.

STOREY COUNTY.

Main lateral drift on the 1100-foot level of the Crown Point, at Virginia, is being cleaned out and retimbered.

On the 2050-foot level of the Con. Cal. & Va., at Virginia, the northwesterly drift 100 feet down from top of winze, sunk from the 1950 to the 2150 foot level, is run 86 feet; repairs to main shaft are made.—The west drift on the 56-foot level of the central tunnel of the Ophir is in 283 feet; face in quartz and porphyry.—The west crosscut on central tunnel level of the Mexican is run 285 feet.—The Hale & Norcross tunnel is in 1991 feet.—At the Sierra Nevada the west drift on the 1600-foot level is cleaned out and repaired for a distance of 920 feet from the shaft.—The main north drift on the surface tunnel level of the Chollar is run 477 feet from the shaft.—The south drift on the 80-foot level of the Greek shaft of the Potosi is out 207 feet; face in quartz, assaying \$3 to \$5 per ton.—In the Silver Hill the northwest drift is in 169 feet; face in porphyry with seam of quartz, assaying \$16.50 in gold per ton. Ore is being taken from the eleventh, twelfth and thirteenth floors of the 425-foot level of the Gould & Curry; 190 tons of this ore sent to the mill returned \$10.63 (coin) per ton.—On the 425-foot level of the Best & Belcher the station at the top of raise, 60 feet up from track floor in No. 9 crosscut, is completed.—On the Utah surface tunnel No. 2 is extended 845 feet; face in hard porphyry.

WASHOE COUNTY.

Wedekind, Johnston & Rice are pushing work on their Zircon claims near Reno.

WHITE PINE COUNTY.

New machinery, including a rotary drier, is going in on the Robust at Ely. Work is progressing satisfactorily.

NEW MEXICO.

COLFAX COUNTY.

More men will be put on at the Lexington, at Raton.

GRANT COUNTY.

The Hanover, at Hanover, is shipping from \$12,000 to \$15,000 worth of high-grade ore monthly.—Daily output of the Iron Head is from \$500 to \$1000.—The Santa Rita Co., at Santa Rita, has begun work in its three double-compartment shafts, and will soon be taking out ore.

LINCOLN COUNTY.

On the Lady Godiva, at White Oaks, ore running 17% copper, 400 ounces silver and ninety ounces gold to the ton is reported opened up; Supt. B. H. Dye.

OREGON.

BAKER COUNTY.

The Columbia M. Co. has put in a new pumping plant on the Columbia, on Snake river, near Baker City. The plant is said to be the largest of the kind in eastern Oregon. The shaft is down 620 feet. The monthly output runs about \$30,000.—A deal is said to be on for the sale of the Brazos. A 10-stamp mill was recently put in on the property. Work is in progress on the 385-foot level.—On the Golconda the sand pipe is down 400 feet. The water pressure in the same is 3500 pounds.—The 20-stamp mill on the Bald Mountain is running.—In the California from 7 to 8 feet per day per drill is said to be made. F. B. Thomes, of Butte, Mont., is said to have bought all the mining property of the Gold Ridge M. Co., near Sumpter, for \$100,000.

At the Carroll, near Baker City, an ore chute 12 inches wide was recently struck at a depth of 80 feet.

The Tillamook G. M. Co. is incorporated at Sumpter, to work the Tillamook group, near there.

The new crosscut on the California, in Cable Cove district, near Baker City, now in 100 feet, is expected to cut the ledge at 400 feet; the new Rand drill is in operation.—A 500-foot tunnel is driven on the Gray Eagle; ledge opened up is said to be 5 feet wide.—A mill will probably go in on the Big Limber creek, near Cable Cove.—A 100-foot crosscut is run on the Morning Star, same district, and drifting is now in progress.

JACKSON COUNTY.

The Gold Hill M. Co. has resumed oper-

ations near Jacksonville.—A recent clean-up at the Jillson, near Hornbrook, weighed nearly ninety pounds after melting.—The Rogue River M. & Lumber Co., W. R. Stansell manager, is working its mines at the head of Foot's creek, near Jacksonville.—G. L. Haff will put in a steam engine on his property in Blackwell district.

J. W. Opp is working the Gold Standard, west of Jacksonville.—The C. & C., in Jump-off-Joe district, is being operated by a Chicago company; Supt. Davis.

JOSEPHINE COUNTY.

J. W. Parker, operating near Leland, will put in an electric plant.—The Fortune M. Co., capital \$1,500,000, is incorporated at Grant's Pass, to work property near the Greenback, near there.—A tunnel is being run on the Big Yank, near Galice.—Placering is going on around Grant's Pass; prospects good for a continuance of work.—Work is progressing on the Yankee Boy, at Myrtle creek.

LANE COUNTY.

The Bohemia G. M. Co. has bought the Paradise, in Bohemia district, from Boren & George. The vein is 4 feet wide and the ore is said to assay \$50 to the ton.

MALHEUR COUNTY.

A strike is reported on the El Dorado, near Malheur.

SOUTH DAKOTA.

CUSTER COUNTY.

The shaft on the North Star, 8 miles northwest of Custer, now down 300 feet, will be sunk to the 500-foot level.

LAWRENCE COUNTY.

The Castle Rock G. M. Co., capital \$1,000,000, is incorporated at Spearfish, and the Blue Stone M. & T. Co., capital \$500,000, is incorporated at Deadwood.

LAWRENCE COUNTY.

The twenty-ton cyanide plant, at North Lead, is enlarged to fifty tons capacity.

The Portland M. Co. of Clinton, Iowa, has its new fifty-ton plant at Central City running.—The new 1200-ton cyanide plant of the Homestake M. Co. at Lead will soon be completed.—It is locally reported that the Golden Reward M. Co. will build a 200-ton cyanide plant at Deadwood.—The Imperial M. Co. of Pennsylvania and the Dakota M. Co. of Deadwood will each build a 100-ton cyanide plant at Deadwood this spring.—The twenty-ton cyanide plant of the Dakota M. Co., at Central City, is sold to Reiley & Barry of the same place. It will soon start up on ore from a mine in Sawpit gulch.

The Shawmut M. Co. of Boston, Mass., which recently bought the old Esmeralda, in Deadwood gulch, Blacktail district, near Deadwood, has erected a fifty-ton cyanide plant on the property. There are six forty-ton cyanide tanks in the mill with a capacity for treating 100 tons of ore per day; two new Huntington mills will go in.—The Boston-South Dakota Co. has completed a 40-stamp mill between the Deadbroke and Esmeralda claims, and it will put in a cyanide annex.

PENNINGTON COUNTY.

The Wealthy group, 4 miles northwest of Keystone, is sold to Sioux Falls men. Work will be pushed.—The Vulcan M. Co. is organized at Keystone to work the Vulcan, 2 miles northwest of Keystone. A steam hoist and mill will go in.—A. D. Arundel of Minneapolis, Minn., will work the Poisoned Ox and Copper Glance properties at Pactola.

UTAH.

BOX ELDER COUNTY.

At the Gold Dust, near Park Valley, twenty-five tons of ore are being put through the mill daily. The capacity of the mill will probably be enlarged this year.

PIUTE COUNTY.

The Banner group, owned by J. P. Osborne, located near Kimberley, is reported sold to Eastern men for \$25,000.

SALT LAKE COUNTY.

An assessment of 3 cents per share is levied by the West Mountain Placer Co., Bingham, payable Feb. 23.—The Mystic Shrine Co. is working the Amazon Nos. 1 and 2 and the Navajo; Manager E. W. Young.—The Starlus M. Co. will begin work on the Starlus group.—A company will be organized to work the Montezuma at Bingham; capital \$200,000.—Supt. Brooks of the Butterfield plant has everything in shape for a continuous run.

Work on the Yosemite tunnel, at Bingham, is temporarily suspended.—Work on foundations for the new concentrator to go in on the May Day is begun, and plant is expected to be in operation by March 20th.

SEVIER COUNTY.

Salt from the deposits near Salina is said to be 90% pure.

SUMMIT COUNTY.

The Kennedy group, near Park City, is sold to D. C. McLaughlin, representing the Anchor M. Co., for \$20,000.—A carload of machinery for the new Silver King sampler is on the ground.—The new boiler for the Daly-West mill is being put in place. It weighs seven tons.—After a shut-down of about three weeks Loring Bros. have again started up their concentrator. A new boiler was put in during the shut-down.

Supt. J. A. Kirby of the Daly-West, Park City, reports the winze down 80 feet below the 1400-foot level.

WASHINGTON COUNTY.

A small smelting plant was recently built at St. George.—Ore from the Savanic, near St. George, goes 40% copper.

Mr. Hunzicker, operating property near the Grand Gulch, proposes to put up a plant to treat ore from the sandstone ledges; ore found in the limestone will be sent to the smelter; about one-half of the fuel used at the smelter is coal furnished by beds near St. George.

WASHINGTON.

FERRY COUNTY.

The capital stock of the United States Marble Co. will be increased from 1,500,000 shares to 2,000,000 shares; properties are about 1 mile from Valley.

The drift on the Chico, Republic, is going ahead at the rate of 3 feet per day.—The Silver Dollar is to be sold to Canadian men for \$20,000.—New York men may buy the Umattila.—The raise on the Morning Glory is being run from the 100-foot level.—Work on the Hercules is suspended until spring, owing to influx of water.

Supt. T. E. Dexter reports good progress being made on the Georgie Reed, about 14 miles south of Republic; upper tunnel ledge is 14 inches wide.

A third interest in a group of five claims located on Iron creek, 8 miles from Keller, has been sold to A. A. Redmond of Republic.

OKANOGAN COUNTY.

Mine owners in Slate Creek district are figuring on putting in an electric plant to furnish power for the mines in that section; site chosen is on Slate creek, where, it is said, water power capable of developing from 5000 to 10,000 H. P. is obtainable.

The crosscut tunnel on the Ninety-Nine is in 240 feet; an air compressor and two Leyner drills will go in early this spring.—The Lone Star, in Palmer Mountain district, near Loomis, is sold to W. F. Elliott; shaft, now down 40 feet, will be continued to the 100-foot level.

STEVENS COUNTY.

The Bear Mountain M. & D. Co. has three shifts driving a 600-foot tunnel on its group on Bear mountain, 16 miles southeast of Colville; the company will soon start work on Stensgar creek.—A tunnel is being driven on the Copper King on Douglas mountain.

Action for appointment of a receiver for the Uncle Sam M. & Dev. Co. is begun in the Superior Court of the county; properties are 6 miles east of Bossburg.

FOREIGN.

BRITISH COLUMBIA.

The Lenora mine is on Mount Sicker, Vancouver Island, 10 miles from the seacoast, 6 miles from the Esquimalt & Nanaimo railway. The company started active work last February and shipped in 1900 about 7000 tons of copper ore under great difficulties, having to haul by wagons. The company has just completed 6½ miles of 3-foot gauge railway, and in three months will have completed 5½ miles more to salt water. One hundred tons daily will be sent over the line. The average of the ore so far sent runs \$20. The country rock is schist and the belt extends for 12 miles from the salt water toward the interior. The adjoining property, called the Tyhee, is expending \$100,000 in purely development work. The machinery will be completed this month, and they will sink a three-compartment shaft for 600 feet. They have already done considerable work, including a 230-foot shaft and crosscuts, and have several other properties which are being opened up on Mount Sicker. The three companies working this district are developing their properties with a view to getting out ore and paying dividends. Victoria, Jan. 23.

The sampler of the reduction works of the British Columbia C. Co. at Greenwood is running; the new mill building is 70x65 feet and 48 feet high. The present capacity is 700 tons ore per day (twenty-four

hours). Six ore bins have a capacity of 3000 tons of ore. The process of sampling is as follows: The ore first goes into a No. 5 Gates crusher, which reduces it to about 4 inches in size; next it goes through a Johnson No. 1 sampler, which takes out one-fifth of the product and rejects the balance, which goes into the sample discard bins below. The one-fifth sample next goes through a No. 2 Gates crusher, which reduces it to 1½ inches. It then drops into a No. 2 Johnson sampler, which takes one-fifth and rejects the remaining four-fifths which pass on to the bins. The sample then goes to a bucket elevator and is carried to the top floor of the building, passing through a shoot back into a No. 6 Gates crusher, which grinds it down to one-half an inch. It then drops into a No. 3 Johnson sampler, which retains one-fifth and discards the balance. The one-fifth passes to a set of 10x20-inch Reliance rolls, crushing to one-eighth of an inch mesh, the whole passing through a second No. 3 Johnson sampler that cuts out one-fifth and sends it to the bucking room. The discarded ore is then taken from the bins direct to the smelter mixture bins for treatment.

On the Phoenix group, at the foot of Erin mountain, near Slocan, the ledge is cut; ore runs about \$70 to the ton; T. S. Dunbar, manager.

The Granby smelter, at Grand Forks, treated 3800 tons of ore during the week ending Jan. 19th; ore produced 130 tons of matte.—In the I. X. L., at Rossland, a strike is made in the tunnel below the lower tunnel; ore is said to average \$100 to the ton.—Thirty-five men are employed at the American Boy, at Sandon; more will be put on. No. 6 tunnel is in 400 feet; vein averages 9 feet across and carries 2½ feet of ore. Twenty-five tons of ore running \$90 to the ton are shipped weekly; output will be doubled within a month.—The tunnel on the Silver Bell and Golden Crown is in over 125 feet.—It is estimated that there are 120,000 tons of siliceous ore, carrying from \$6 to \$8 in gold to the ton, on the dump at the Le Roi.—At Deadwood good ore is opened up on the 250-foot level of the Crown Silver. The south drift is in 225 feet and the north drift is in 125 feet; twenty-three men are employed; Supt., H. Johns.—The shaft on the Sunset is down 200 feet.—The shaft on the B. C., in Summit Camp, is down 422 feet; levels are being run at 325 and 400 feet.—Work on the Sunset, near Princeton, will resume in about three weeks.—Three thousand acres of coal lands, 5 miles north of Fairview, in the Yale district, are reported sold to Toronto men; the coal is said to be of good cooking quality.

The Iron Mask, at Rossland, is reported bonded to E. D. Levenson of London, England, for \$400,000.

Shipments of ore from mines at Rossland for week ending Jan. 26th were as follows:

	Tons.
Le Roi.....	3,540
Centre Star.....	2,160
War Eagle.....	780
Iron Mask.....	190
Le Roi No. 2.....	250
Velvet.....	125
I. X. L.....	22

Total.....7,067

The tunnel on the Bonanza, Rossland, is in 120 feet.—Sinking is in progress on the Centre Star.—The tramway on the War Eagle is nearing completion; shaft is being sunk and development work is going on in the seventh and eighth levels.—On the Rossland-Great Western the shaft is down 715 feet; another stope is started on the 600-foot level to the west of the shaft; foundations for compressor are completed and ready for machinery.—The shaft on the Le Roi, now down 900 feet, is to go to the 1500-foot level.—Two shifts are working in tunnel No. 2 of the Big Four; upper tunnel will be extended 50 feet.—Work is under way in the 400, 450 and 500-foot levels of the Iron Mask.—The 18-drill air compressor now going in on the Velvet will be in operation March 1.—On the Northern Belle the crosscut tunnel is in 365 feet.—The north drift on the new St. Elmo is in 75 feet and the south drift is in 325 feet.—Drifting is in progress on the 100-foot level of the Portland.—Crosscutting is going on in the 300 and 400-foot levels of the Evening Star.

The main tunnel in the Queen Bess, at Alamo Siding, in the Slocan, is in 1700 feet; it is 7x9 feet; progress made so far averages about 100 feet per month.

Finch & Campbell of Spokane, Wash., operating the Second Relief, on Whiskey creek, 8 miles from Ymir—R. K. Neill representative—will put in a 20-stamp mill this spring. When in, this will make a total of 120 stamps in the Ymir district. Two hundred and fifty feet of driving will soon be done in the lower level. Seventy-five men will be employed.—Work on the Big Five, near Sandon, resident man-

ager G. B. McDonald, will be resumed soon.

CHINA.

The deepest workings attained on the Cha-li-h, near Cha-li-h, are 1500 feet; ore is said to run 3½ ounces gold to the ton.

MEXICO.

The shaft on the La Fortuna, Sonora, is down 300 feet; shaft is only used for hoisting ore, as mine is worked through the La Gloria shaft, 1500 feet distant.—On the La Gloria an incline shaft follows the vein to a depth of 1100 feet; a steam hoist, an 8 drill air compressor, an electric light plant and pump are on the property.—The concentrating plant at La Concentration, Sonora, has a daily capacity for fifty tons ore.

The Copper Queen Co. of Bisbee, Ariz., has run a 400-foot tunnel on its property at Nacosari, Sonora; it is putting in a railroad to the smelter at that point.

THE KLONDIKE.

The Lucky Day G. M. Co. of Florence, Colo., has sunk the shaft on the Bonanza 175 feet; ore carries white iron and copper, and is said to run \$20 in gold and silver to the ton; a new hoisting plant and blacksmith shop are up and two shifts are employed; first shipment of ore will be made shortly to the American Zinc-Lead Works at Canyon City.

Personal.

E. PIERCE, of New York, is in Randsburg, Cal.

R. DARLING, of Denver, Colo., is in Yuma, Ariz.

W. W. LOWE of Long Beach, Cal., has gone to Mexico.

T. L. AYRES of San Francisco, Cal., is in Kingman, Ariz.

W. J. SHARWOOD of Marysville, Mont., is in San Francisco.

W. E. JOHNSON of Florence, Colo., is in Salt Lake, Utah.

ROSS E. BROWNE of San Francisco is in Grass Valley, Cal.

G. S. PEYTON has returned to Salt Lake, Utah, from the East.

J. F. AUSTIN, formerly of the Germania smelter, Salt Lake, Utah, goes to Everett,

Wash., to take charge of a 300-ton plant at that point.

B. E. SHEARER of Denver, Colo., is in Salt Lake, Utah.

J. MURRAY is appointed receiver Marie Co., Cripple Creek, Colo.

SUPT. KIRBY of the Daly-West, Park City, Utah, is in San Francisco.

A. J. McDONNELL has taken charge of the Union Con. mine, Virginia, Nev.

E. E. FLOYD of the Mass Con. M. Co. has resigned as president and director.

A. BURCHAM, president Yellow Aster Co., Randsburg, Cal., is in San Francisco.

T. H. OXNAM has returned to Los Angeles, Cal., from inspection of the Palmarago, Mexico, mine.

J. W. CUSHING of Sandy, Utah, goes to East Helena, Mont., as overseer in the sampling plant at that place.

ADOLPHE CARNOT has been appointed director Paris School of Mines, succeeding Haton de la Goupilliere.

W. H. KNOWLES, Supt. Crown Point and Virginia, Idaho Springs, Colo., has returned there from Chicago.

Books Received.

"Chemists' Pocket Manual," pp. 204; Richard K. Meade: Designed for use of chemists, assayers and metallurgists; a useful compendium of formulae, calculations, tests and tables, conveniently indexed. Price, \$2. The Chemical Publishing Co., Easton, Pa.

"Handbook of Practice," 8vo., pp. 164; D. H. Bergey: A laboratory guide as to sanitary analysis and ventilation. Price \$1.50. The Chemical Publishing Co., Easton, Pa.

"Elementary Organic Analysis," 8vo., pp. 86; F. G. Benedict: Determination of carbon and hydrogen; combustion of various bodies. Price \$1. The Chemical Publishing Co., Easton, Pa.

"Evolution of the Thermometer," 12mo., pp. 96; H. C. Bolton: An illustrated history of the thermometer, with descriptions and comparisons of the various kinds. Price \$1. The Chemical Publishing Co., Easton, Pa.

"A Textbook of Urine Analysis," 8vo., pp. 244; Jno. H. Long: Illustrated; for medical students and medical practitioners.

ers; chemical physiology, with microscopic tests. The list of reagents and test solutions is unusually complete. Price \$1.50. The Chemical Publishing Co., Easton, Pa.

"A Plain Statement of the Law Relating to the Location of Mining Claims, Including the State and Territorial Laws of Nevada, Arizona and Alaska," is the title of a concise compilation in handy form written by C. W. Hollister, Ph. D., and published by Wm. T. Smith & Co., assayers, of Los Angeles, Cal., at 15 cents per copy.

"Reservoirs for Irrigation, Water Power and Domestic Water Supply, With an Account of Various Types of Dams and the Methods and Plans of Their Construction," large 8vo., pp. 432, 183 figures, 25 plates; James Dix Schuyler. The present interest in the subject suggests demand for technical information thereon, and this work is to be commended for its complete and practical nature. The chapters on rock-fill dams, hydraulic-fill, masonry, and earthen dams, natural and projected reservoirs, are accurate and clear. Particular attention is paid to the west half of America, and the principal existing dams on the Pacific coast are illustrated and described. Published by John Wiley & Sons, New York City; \$5.

Commercial Paragraphs.

THE Otis Elevator Co., of New York and Chicago, is represented in Denver by J. F. Elan.

D. HUG, patentee and manufacturer of the Hug water wheel, Denver, Colo., has moved into larger shop quarters at 1514 Blake street, where his facilities for turning out work will be increased.

A. E. LINDROOTH, Denver manager Link-Belt Machinery Co., and H. H. Fielding, manager Denver branch for Warren Webster & Co., have moved their offices to 822 Boston Building, Denver, Colo.

THE Gutta Percha & Rubber Mfg. Co. state they have had a larger volume of business for the past year than during any year since their being established in San Francisco. This they attribute to the universal satisfaction which their Maltese Cross belting has been giving.

Latest Market Reports.

SAN FRANCISCO, Jan. 31, 1901.

SILVER—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 60c (1000 fine); San Francisco, 60c; Mexican dollars, 50c.

The continued fall in silver is attracting attention. Just now the Indian Government is the only buyer, taking about \$150,000 worth a week; the amount received from New York alone is about \$250,000 weekly. San Francisco shipments are not unusually heavy.

COPPER.—New York: Lake, 1 to 3 casks, \$17.00; carload lots, 16.75; Electrolytic, 1 to 3 casks, 16.75; carload lots, 16.50; Casting, 1 to 3 casks, 16.50; carload lots, 16.37½. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

The 1900 export of fine copper from the United States to Great Britain was 28,218 tons.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.20; Missouri lead, \$4.32½ desilverized lead; San Francisco \$5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6½, sheet 7½, bar 6c; pig, \$4.70 @5.10. London, £15 9s per ton.

During 1900 Great Britain imported from the United States 40,724 long tons lead, mostly Mexican, refined in this country in bond.

SPELTER.—New York, \$4.10; St. Louis, \$3.90; London, £18 6s per ton; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, \$13.30; gray forge, \$13.40; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$19.60; open hearth billets, \$21.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.25; San Francisco, ton lots, 29c; 1000 lbs., 29½c; 500 lbs., 29½c; less, 30c; bar tin, \$1 lb, 35c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.50 per flask of 76½ lbs.; Export, \$44.

NICKEL.—New York, 50@60c per lb. **MAGNESIUM**.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 15½c.

ASSAY LITHARGE.—San Francisco, 10c per lb, small lots.

BISMUTH.—New York, \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 per lb.

PLATINUM.—San Francisco, crude, \$17 per oz.; New York, \$18.20 per Troy oz.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

PHOSPHORUS.—F. o. b. New York 50@60c per lb.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@33½c per lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c per lb.; soda ash, \$1.60 per 100 lbs. 58%; hyposulphite of soda, 24@25c per lb.; blue vitriol, 5½@6c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2½@2¾c; California refined, 1½@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., \$1.00; sks, 95c per 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

TUNGSTEN.—New York, \$1.95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

SITUATIONS WANTED.

WANTED—A position as superintendent for a mining company by a man of 16 years' practical mining experience; understands mining and milling (amalgamation, concentration and leaching); good assayer and accountant; would accept a subordinate position if good; references. Address "Advertiser," 1225 Webster St., Oakland, Cal.

A position as superintendent or mining foreman by a man of 20 years' practical experience in mining in all its branches in the different mines in California and Mexico—gold, silver, copper and quicksilver mines. Have had the handling of large forces of men. Can speak Spanish. Can go through and secure any kind of ground. The best of references. D. E. F., care this office.

A sober, industrious young man, who is a competent assayer, surveyor, draughtsman and bookkeeper, wishes a situation. Has had eighteen months' practical experience and two years' technical training. Is willing to make himself generally useful about a mine. Salary reasonable; opportunity to show ability considered first. References. Address E. M., Mining and Scientific Press.

CHEMIST AND ASSAYER, with experience in draughting, bookkeeping and typewriting, desires position as assayer or assayer and bookkeeper in mine or as secretary to mining engineer or mine official. Has fair literary and scientific education. Experience in the preparation of reports, prospectuses and catalogues. Excellent moral character and good health. For further particulars, address E. K. M., care Mining and Scientific Press.

Situation Wanted by Mining Engineer of 20 years' experience in California, Colorado, Mexico and Germany. Has had charge of large properties—gold, silver, lead, copper, sulphur and oil. College graduate; good assayer, surveyor and accountant; speaks Spanish. Has experience in railroad construction and road building. Formerly U. S. deputy mineral surveyor and member of geological field force. Will go anywhere. Address P. M., Mining and Scientific Press.

Mining Accountant and Store Manager.

A young man of energy and ability, and thoroughly experienced in all details of mine accounting, store managing, buying, contracting, etc., is desirous of obtaining an opening. Is fully qualified to assume full charge of such work or to render general assistance. Highest references will be furnished and satisfactory services guaranteed. Address B. P. O., care this office.

WANTED.

MINE PROMOTER WANTED

To influence capital in a developed gold mine near Buffalo Hump, Idaho. Address Mineral Recorder, Elk City, Idaho.

WANTED—GOOD SECOND-HAND SET CRUSHING ROLLS.

State price and particulars to THE MOUNTAIN COPPER CO., Ltd., Keswick, Shasta Co., Cal.

WANTED.

Assayer, Chemist and Surveyor, with Surveying Instruments.

Must furnish good references as to character and ability and from previous positions. Give age; experience. Single man preferred. Steady work. Wages \$75 per month and board.

Address A. C. S., Box 512, Prescott, Arizona.

Big Vein Cyaniding Ore IN MONTANA.

Over 12 feet wide; values \$5 to \$30, gold and silver. Mine can be developed cheaply by tunnels to depth of 600 feet. Many improvements; 1500 feet work done; bul dings up, and good road; timber and water. Prospect for a big mine seldom equaled. Lease and bond on favorable terms. D. S. M., care this office.

BRITISH COLUMBIA MINES.

Gold, Silver-Lead and Copper Properties. Excellent chance for profitable investments in legitimate mining in BRITISH COLUMBIA. Capital needed for developing promising prospects. A specialty made of FREE MILLING GOLD properties. Very promising FREE MILLING GOLD properties for sale; terms reasonable. Mines examined and reported on by reliable mining engineers. Correspondence solicited. Address Andrew F. Rosenberger, P. O. Box 700, Nelson, B. C.

Quicksilver BY THE FLASK OR CARLOAD.

The Eureka Company, OF SAN FRANCISCO, 320 SANSOME STREET, - SAN FRANCISCO.

HEADQUARTERS FOR QUICKSILVER.

LOWEST RATES. Correspondence Solicited. LANGLEY & MICHAELS CO., 34-40 FIRST STREET, SAN FRANCISCO.

Save 15 to 50 Per Cent on Your Water Pipe. THE SPOKANE Galvanized Wire Pipe Co.

FOR SALE.

FOR SALE.

Developed Silver-Lead Mines and Prospects, Parral and Santa Barbara Districts of Mexico. The coming greatest camp in the Republic. Correspondence solicited. H. E. RUNKLE, El Paso, Texas.

COMPRESSOR AND HOISTS FOR SALE.

1 4-drill Norwalk steam compressor, compound air cylinders.
1 6"x8" double engine, single reel hoist.
1 8"x10" double engine, double reel hoist.
1 double reel water or steam hoist.

Machinery all practically new. Convenient for inspection. Address "BARGAIN," P. O. Box P, Auburn, Cal.

GUARANTEED MINING STOCK FOR SALE.

Excellent chance for profit. No chance for loss. Can convince the most skeptical that our way of guaranteeing mining stock is perfectly safe and one of the most desirable investments. Can furnish highest grade of references. Write or call for particulars, if you wish to purchase, on

E. N. BREITUNG & CO., BROKERS, Marquette, Mich. Washington, D. C.

ORE CARS AND BUCKETS.

Best cars made, and guaranteed in every way. From \$25.00 up. Can save you 25 per cent on any size car.

Send for Catalogue No. 37.

THE S. H. SUPPLY CO., 22nd and Larimer Sts., DENVER, COLO.

NOTICE OF AMENDMENT OF ARTICLES OF INCORPORATION.

Notice is hereby given that it is the intention of the JAMISON MINING COMPANY to amend its Articles of Incorporation by substituting for the second of said articles setting forth the purposes of the Corporation, which now reads:

"2nd. That the purposes for which it is formed are: The acquisition of quartz mines and gravel mines in the State of California, and to work the same for gold and silver; also, to acquire, hold and use water and water-rights and privileges in connection with such mining; also, to acquire, hold and use timber lands in connection with such mining," the following:

Second.—That the purposes for which it is formed are: To mine for, and mill and reduce ores of all kinds; to acquire by location, purchase or otherwise, to own, hold, work and operate mines in and throughout the State of California; to acquire by purchase or otherwise, to own, hold, develop, improve, lease, let, mortgage, grant, bargain, sell and convey mines, and mining claims and properties in the State of California; to acquire, by purchase or otherwise, to build, erect, construct, own, operate, lease, let, mortgage, grant, bargain, sell and convey mills, and other reduction and smelting works, for the milling and reduction and smelting of ores, and to deal in precious metals and minerals and the products of men of every kind, and to transport and provide ways and means to transport the same to market, and to market and sell the same; to acquire, by purchase or otherwise, to improve, develop, own, hold, use, lease, let, mortgage, grant, bargain, sell and convey real property, land, water, water-rights, privileges, and franchises of every kind, in and throughout the State of California; to buy, own, hold, sell and generally deal in goods, wares and merchandise, and all kinds of personal property, including the stocks of other corporations, also bonds, notes and personal securities of every kind. To establish and maintain agencies of said Corporation, and to appoint and employ agents, wherever it may be deemed best by said Company; and generally to do any and everything necessary, proper or expedient to carry out the aforesaid purposes and carry on the business of said Corporation.

NOTICE OF STOCKHOLDERS' MEETING.

A Special Meeting of the Stockholders of the JAMISON MINING COMPANY for the purpose of considering and acting upon the matter of Amending its Articles of Incorporation, as above provided, will be held at the office of the company, room 54, 180 Sutter street, San Francisco, California, at two o'clock P. M. on Monday, the 11th day of February, 1901.

By order of the Board at its meeting of December 31st, 1900. SAM W. CHEYNEY, Secretary Jamison Mining Company.

WE CONVEY EVERYTHING.

ELEVATE TACKS, SAND, ROCK, ORES, RED HOT IRON, MOLTEN SLAG, COAL AND SALT.

CONVEYORS AND ELEVATORS MADE BY C. O. BARTLETT & CO. CLEVELAND, OHIO.

BEST CONVEYOR FOR FEEDING ORE CRUSHERS.

WE BUY very rich Ores, Dental Scraps, Tellurium Ores, Mill Wastes, Jewelers' Sweeps, Gold Retorts, Old Iron Retorts, Base Amalgam, Quicksilver, Amalgamated Plates, Gold and Silver, Old Slags.

THE BRETHERTON HOT BLAST.

APPARATUS FOR PYRITIC SMELTING. It saves fuel, increases capacity of furnace, improves character of work, does not require a hot top causing volatilization like other inventions, furnishes pure air heated without cost, can be attached to furnaces already in use, is an all around money saver, built and used by practical, successful metallurgists. Write for particulars to

DRY PLACER MACHINES.

THE PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED. Gives a clean prospect from placer ground or re-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 20 to 30 yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries. SEND FOR DESCRIPTIVE CIRCULAR.

GATES IRON WORKS

The Copper Furnace herewith reproduced is one of two sold to the GRANBY CONSOLIDATED MINING AND SMELTING CO., LTD., BRITISH COLUMBIA. The size is 44x160 inches. These two furnaces were sold on a guaranteed capacity of 500 tons per day. Before the furnaces had been in operation a month they developed an average capacity of 600 tons per day, and the highest daily record has exceeded 735 tons. The cost of operation has steadily declined under the management of General Manager Hodges, until six-dollar copper ore is paying a handsome profit.

All of GATES IRON WORKS machinery is as good as it is represented to be, and often much better. We build every modern type of apparatus for the reduction of the precious ores by every established process. Our three great lines are these:

**Mining
Machinery,
Rock and Ore
Crushing
and
Cement
Machinery.**

FULL DETAILS OF OUR SMELTING
FURNACES GIVEN IN OUR

81 SO. CLARK STREET, CHICAGO, ILL.

THE COLORADO IRON WORKS COMPANY,

ENGINEERS AND MANUFACTURERS OF

Smelting Furnaces and Equipments.

The illustration in this advertisement shows one form of our COPPER MATTING FURNACE, employing hot blast; the air being first treated in proper appliance, is conducted through the cast iron bustle pipes placed along the inside of the caisson plates, through the cast iron adjustable tuyeres. This furnace can also be used for silver as well as copper smelting, by changing lining in crucibles. We build them in any size required.

Cold blast may be used if preferred.

The furnace is equipped with our special cast iron jackets, and our patented system of water-jacketed mantles.

Send for our catalogue, showing many different styles of smelters for the treatment of

GOLD, SILVER, LEAD, COPPER AND NICKEL ORES,

also the latest and best method for the economical use of jacket water (a saving of 80% to 90% guaranteed) by our patented

WATER VAPORIZING ATTACHMENT.

We design, manufacture and erect Mills for Concentration and Amalgamation, Milling, Chlorination and Cyanide Processes. In writing for information, give us the analysis or character of the ore to be treated, to enable us to intelligently arrive at the proper method.

Our very complete catalogue of CRUSHING MACHINERY will be sent on application.

DENVER, COLO., U. S. A.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

SPECIFICATIONS (Condensed).

- 6 ORE GATES, 24 x 38, rack, hand wheel, frames, bolts, complete.
- 2 ORE BINS, all necessary bolts, rods, nuts and washers.
- 2 GRIZZLEYS, 4' x 10', 1" openings.
- 6 CHALLENGE AUTOMATIC ORE FEEDERS, including hoppers, wood frame, shafts and pulleys.
- 6 HUNTINGTON CENTRIFUGAL ROLLER MILLS, 5' diameter, all fixtures and fittings, complete with wooden frame, shafts, pulleys and gearing.
- 6 COPPER TABLES, 6' x 12', $\frac{1}{8}$ " copper, electroplated 1 oz. of silver per square foot.
- 2 AMALGAM SAFES.
- 1 BELT TIGHTENER, complete with pulley, boxes, etc., for main belt.
- 1 BELT TIGHTENER, complete with pulley, boxes, etc., for crusher.
- 1 CORLISS ENGINE, built by Fraser & Chalmers, cylinder 20" diameter by 48" stroke, complete in every particular, shaft 10" in diameter, band flywheel 16' diameter, 30" face; weight, 42,000 pounds.
- 3 HORIZONTAL TUBULAR BOILERS, 54" diameter, 16' long, complete with steam drums 30" x 72", mud drums 18" x 66" for each boiler, breechings, smoke box, stack 48" diameter 60' long, all necessary guy rope, half arch fronts, grate bars, cast and wrought iron parts necessary for setting, feed, blow off check and safety valves, gauges and all fittings. Weight, 51,000 lbs. At present these boilers are arranged for setting in one battery. We will make any changes required, furnishing stacks and other items necessary to set each boiler separately.
- 1 HEATER, tubular, 30" diameter, complete, with exhaust pipe.
- 2 NO. 5 KNOWLES BOILER FEED PUMPS.
- 1 BERRYMAN HEATER, 18" diameter by 7' long, copper tubes, 4" pipe inlet and outlet.
- 1 HOOKER VERTICAL SINKING PUMP, 14x8x14, 6" suction 5" discharge.
- 8 ORE CARS, one ton capacity each.
- 1 WATER WHEEL, 50 H. P.
- 1 16" BULLION FURNACE, complete, including 10" Gold Retort, stack and all iron work.
- 1 NO. 5 STYLE B GATES FINE CRUSHER.
- 1 LOT REPAIR PARTS FOR HUNTINGTON MILLS, including roller shells, ring dies, scraper bars, shoes, screens, clamping plates, all new, never used.
- 1 LARGE LOT OF PIPE AND FITTINGS.
- 1 LOT BOLTS, WASHERS, RIVETS AND NUTS.
- 1 LOT OF MISCELLANEOUS SHAFTING, PULLEYS, PILLOW BLOCKS, HANGERS, ETC.
- 120' RUBBER BELTING, 28", 6-ply.
- 58' RUBBER BELTING, 18", 4-ply.
- 150' RUBBER BELTING, 16", 4-ply.
- 70' RUBBER BELTING, 14", 4-ply.
- 2 LOCOMOTIVES, 20" gauge, built by H. K. Porter Co., Pittsburgh, one 6x10 cylinders, the other 8x14 cylinders, both saddle tank.

WOODBURY'S SIDE SHAKE CONCENTRATOR.

THIS Concentrator is superior to any other Belt Machine. It has an iron frame, steel shaking frame, and built in the most thorough manner. The patent distributing device distributes the pulp evenly over the whole working surface of the belt; thereby it enables the machine to perform perfect work, and giving more capacity to the Concentrator than any other Belt Machine. The variable eccentric crank gives the machine greater capability to work different classes of ore. I will warrant this machine as having more capacity than any other Concentrator.

Simple in Its Construction - Saves Fine Sulphurets -
Without Loss in Tailings
- Makes High Product - Capacity from 5 Stamps

TREAT YOUR ORES,
SAVE YOUR VALUES,

CONCENTRATE
AND
AMALGAMATE

In substance at one operation
by the

Hooper
Pneumatic
System.

Floor Space, 3x6 Ft. Weight, 2250 Lbs.
Capacity, 10 to 50 Tons Daily.

WE USE NEITHER

WATER, CHEMICALS NOR QUICKSILVER.

Ores, etc., Treated:

Gold,	Copper,	Corundum,
Lead,	Chrome,	Antimony,
Zinc,	Nickel,	Cinnabar,
Mica,	Clays,	Black Sands,
Tin,	Garnet,	Any Sands,
Slags,	Graphite,	Mixed Ores,
Silver,	Fluor Spar,	Metallic Ores.

SAMPLE LOTS TREATED FREE.

WRITE FOR SHIPPING TAGS.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best **GOLD** saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two
years' use am convinced it is the only machine
that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine
or coarse, with proper usage. We save Gold read-
ily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Sam-
ples (concentrates) received and are finest work I
have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver
Treatment, Ft. Wayne, Ind., says: "That little
machine is a daisy. The fact that you readily
save values that float on water is to me the most
convincing argument against the wet system."

The Hooper Pneumatic System

Is the only reliable method of treating
mixed, silty or rebellious ores. Zinc
and lead combinations handled in good
shape.

THE Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,
Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,
121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

KNIGHT'S WATER WHEEL.

The accompanying cut shows the general arrangement of The Knight Water Wheel, direct coupled to a 750 kilowatt generator, with governor mounted on top of wheel casing. These wheels are designed for 100 to 2500 H. P. Highest efficiency and regulation guaranteed. **WHEELS FROM 6 TO 24 INCHES, ENCLOSED IN CAST-IRON CASING.** Wheels for mill and reversible hoisting works a specialty.

Triplex Single Acting Pump Direct Connected to GE Induction Motor.

General Office: Schenectady, N. Y.
San Francisco Office: Claus Spreckels Bldg. Denver Office: Kittredge Building.

THE SNODGRASS HAND POWER COMMON SENSE PULVERIZER & CONCENTRATOR.

This Hand Power Machine is built on the same general principle as the regular machines, only being smaller in size and capacity. While this is intended to be run by hand power, it can easily be changed for steam or gasoline by simply putting on the pulley in place of the gearing. This has a capacity of 1 1/2 to 2 tons per hour. This is just the machine for working at Cape Nome and other places where it is difficult to procure wood, coal, or gasoline for power. It requires but a small amount of water, and a pump can be attached, so that one person can pump the water as well as run the machine. It can easily be moved from place to place, as the heaviest part only weighs about 550 lbs., the total weight being about 500 lbs.

Address S. K. SNODGRASS, DENVER, COLO. (The Windsor.)

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge. Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and 1/4 inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

P & B ROOFING

ROOFING is to a building what clothing is to the body. It must protect and it must wear well. To put money in an interior and to save it on the roof of a building is poor economy. P & B ROOFING possesses all the requirements of a first-class roof covering. It is waterproof, durable, inexpensive, easily laid. Ask your dealer for a circular, or address the makers.

THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested by our own and our customers' experience during the past twenty years.

They are being used by more than nine-tenths of the prominent American engine builders, who are good judges of lubricators. Many of these have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use, or more than all other styles combined.

Use the Detroit lubricators and you will be in good company. Our new catalogue, showing our full line, will be sent on application.

ASSESSMENT NOTICES.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of December, 1900, an assessment (No. 20) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 2nd day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
JOSEPH H. MOOSER, Secretary.
Office—320 Sansome street, room 24, San Francisco, California.

TANANA MINING COMPANY.—Location of principal place of business, San Francisco, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of December, A. D. 1900, an assessment (No. 2) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, Edward H. Stearns, at his office, Room 801 Claus Spreckels Building, Cor. Third and Market Sts., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 6th day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
EDWARD H. STEARNS, Secretary.
Office—Room 801 Claus Spreckels Building, Cor. Third and Market Sts., San Francisco, California.

YUBA RIVER GOLD DREDGING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Smartsville, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of January, 1901, an assessment (No. 2) of three cents (3 cents) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 214 Pine street, Room 29, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
ALBERT CERR, Secretary.
Office—No. 214 Pine street, Room 29, San Francisco, California.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of January, 1901, an assessment (No. 9) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 18th day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
N. F. REMINGTON, Secretary.
Office—112 Main street, San Francisco, California.

STEAM AND ELECTRIC HOISTS, CRUSHERS, ROLLS, REVOLVING SCREENS, JIGS, ORE CARS, CYANIDE TANKS, CORNISH PUMPS, CORLISS ENGINES.

SMOOTH-ON

COMPOUND

AN IRON CEMENT

For repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts the same as iron, insuring a tight joint at all temperatures. Difficult flanged connections can easily be made with **SMOOTH-ON COMPOUND**, as it adapts itself to the flanged faces, whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching.

Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

A Small Stamp Mill.

Representation is here given of the recently constructed mill of the Magnet Mining & Milling Co., near Gold, Madera Co., Cal., as a type of the many small mills, capable of enlargement, which are now going up throughout the mining districts of California. The stamps, of 850 pounds weight each, are run with a speed of 110 to 115 drops per minute. The mill is provided with a concentrator and other modern gold-saving appliances. The power at present used is steam; water power is available for six months in the year, and will be utilized as soon as the necessary dam can be built. Hitherto the ore has been extracted from workings about 500 feet distant from the mill, transportation being effected by means of an automatic tramway, shown in the illustration. The ore so far taken out and milled has given satisfactory returns to the owners; and to facilitate extraction, as well as to drain the surface water from the mine, a main working tunnel is being driven along the footwall of the vein on a level with the ore bin of the mill, giving a depth of 200 feet on the ore chute in the upper workings.

In the same vicinity are the Mud Springs, Waterloo and Five Oaks mines, all producing and of the class of mining properties that are feeders to the general mining prosperity of the State, tending to develop into large properties and creating a cash demand for supplies of all kinds.

Largest Gas Engine Yet Made on the Pacific Coast.

On this page is illustrated the largest gas engine ever manufactured on this side of the continent. This was built by the Union Gas Engine Co., 240-246 First St., San Francisco, Cal. The estimated power is from 350 to 360 brake horse power. It was built for the San Francisco Gas & Electric Co., and is intended to drive, through direct connection, a 200 kilowatt generator. The approximate weight of engine is fifty tons; length over all, 29½ feet; width, 8 feet 2 inches; height, 12 feet 9 inches. This engine is of the four-cylinder type and is so arranged that one or more cylinders can be "cut out" even while engine is in operation. A self-starting device is connected to each cylinder. The manufacturers say that this engine is guaranteed to regulate within 2½%. The Union Gas Engine Co. expects soon to build engines of 500 H. P. each, which shows that, here on the

Mill of the Magnet Mine, Madera Co., Cal.

Pacific coast, power users are realizing that the gas engine is rapidly coming to the front as a motive power.

STEAM TURBINES is the subject of special discussion by those interested in steam engineering, the principle being now thoroughly established that a jet of steam issuing through a properly constructed orifice has as much energy as the same steam performing ratios of expansion behind a piston. The steam turbine is constructed to utilize the maximum energy of the steam. Some experiences detailed by F. Hodgkinson in connection with an experimental plant built by the Westinghouse Air Brake Co. are of special interest. A steam turbine plant was put in and run for about nine months, then shut down, and the steam engines which had previously done the same work were reconnected, and, after a time trial test, the turbine plant again put into operation, with a stated average saving in coal of 35.7% during the day and 36.4% during the night in favor of the turbines. The saving in feed water is also stated to have been 29.8% during the day and 41.4% during the night. The advantages of electric transmission and the absence of long steam pipe condensation aided in the economical showing in favor of the turbines. The application of the steam turbine is so far somewhat limited, being deemed particularly applicable to driving electrical machinery. The most prominent form of direct application has been to marine propulsion. In the vessel, the Turbina, built by Mr. Parsons, a speed of nearly 39 miles per hour has been attained.

360 H. P. "Union" Gas Engine.

THE newest thing in power development is the effort to construct large double-acting gas engines along the same lines as steam engines, work to be done on the piston at each stroke. M. Koerting of Germany has built a 350 H. P. gas engine on the same general plan as a steam engine, and a test with power gas, at full load, lasting one hour, is reported to have converted 38% of heat into indicated work. With even 25%, the idea would be a practical success. The Koerting gas engine is a 2-cycle, double-acting motor; no mixing pump for the gas and air, each having its own pump, each of these having piston valves worked from an eccentric on the crank shaft, delivering air and gas respectively through two separate pipes into openings in front of the admission valve, at either end of the cylinder. The cooling water for the piston and piston rod is carried through sliding telescopic tubes moving to and fro with the crosshead on angled joint between them, with a rotating stuffing-box. The latter and the double-acting piston constitute two interesting factors in the proposition. The trials made of the advanced construction warrant the builder in carrying on further experiments

SEVERAL State legislatures are in session and some of those not engaged in the protracted work of electing U. S. Senators are endeavoring to enact additional mining legislation. Apart from the usual "cinch" bills, redolent of "graft," and almost avowedly introduced as a source of illicit individual revenue, are some apparently actuated by honest desire to do some good, but not what the mining industry wants. As a general thing, all that the mine operator asks of a legislature is that he be let alone. State legislation, however well-intentioned, usually hurts and hinders more than it helps, for a corrupt legislator, like the bull in the china shop, soils all he omits to shiver. Colorado, Idaho and Oregon seem to want increased taxation on mining properties, though earnest protests on the part of mine owners in those three States may defeat the proposed laws. In Idaho the Governor makes the ridiculous proposition that all producing properties be taxed. His suggestion might well be entitled "An Act to throttle the development of the mining industry of Idaho." Colorado has had more experience in such mistaken legislation and will probably note the protests from Teller county and other sections of the State. The California legislature has so far shown good judgment in its attitude toward proposed mining measures. Some of the mining "laws" introduced at the present session are so plainly cinch bills that they deserve the scant courtesy accorded them. Senate bill No. 106, in the California legislature, is honestly intended to be of benefit, but deserves defeat. Such a law was passed in 1897, repealed in 1899 and re-repealed in 1900. In addition, the bill mentioned conflicts with the U. S. Statutes, and, if passed, after considerable annoyance and expense, would be so declared. Senate bill 378, "fixing and defining a miner's inch," is a good one and deserves unanimous passage. Assembly bill 143, "providing for the inspection of illuminating oils," etc., should be rightly called "An Act to check the oil development of California." It is very "raw," and beneath contempt or ridicule. Montana and Nevada legislatures have just passed acts making eight hours a day's work in all mines, mills and smelting establishments in those States. Such legislation is generally held to be constitutional, where the law is of general application, but it is not vouchsafed a legislature to pass any law regulating wages in any way.

THE merging of the American Smelting & Refining Co. and the Guggenheim interests in the new organization of the American Smelting Co. brings a statement from the Guggenheims that they can "work out bigger problems to better advantage doubly than

singly." They say that they "have kept up the price of lead, and propose to do the same with silver," and hope in time "to handle silver as intelligently as they have jointly treated lead." The assertion is made that silver is now "scientifically and secretly bought by four brokers in London who stand in with each other and the buyer." This they propose to change.

Development of the Mineral Industry.

Deserved prominence is given by the Government Bureau of Statistics to an official statement showing that mineral products, crude and manufactured, have become in recent years a great feature of the domestic exports of the United States. Of the \$1,565,228,606 exports of domestic products, including gold and silver, in the year 1900, \$436,227,477 in value were composed of mineral products, showing that 28% of the total domestic exports originated beneath the surface of the earth. Much of their selling value was, of course, added by the labor which turned them into form required for use. The exports of iron and steel, for instance, amounted in 1900 to \$130,000,000; mineral oils of all classes, \$75,000,000; copper, nearly \$60,000,000; coal and coke, \$22,000,000; paraffine, \$8,000,000; phosphates, \$5,000,000. The gold production exported amounted to \$52,787,523, the silver to \$59,272,668.

Of exports of minerals, metals and manufactures thereof, exclusive of gold and silver, the total for 1890 was \$103,693,955; in 1900, \$324,167,286, more than three times as much as ten years before. Of gold, the domestic product exported in 1890 amounted to \$20,654,960; in 1900, to \$52,787,523. Of silver, the exports of 1890 were \$16,098,180; of 1900, \$59,272,668. The value of metals, minerals and the products thereof exported in 1900, exclusive of gold and silver, showed an increase of 218% over 1890, and including gold and silver, an increase of 210%. The total domestic exports, excluding gold and silver, showed during the same time an increase of only 77%.

At the same time imports of mineral character have materially decreased, except in case of natural products not obtained from the mines of the United States, but required for use in manufacturing. Imports of manufactures of iron and steel, for instance, fell from \$41,679,501 in 1890 to \$20,443,908 in 1900, while pig tin used in the manufacture of tinplate has increased from about \$6,500,000 in 1890 to \$19,458,586 in 1900.

The following table, compiled by the Treasury Bureau of Statistics, showing the exportations in 1890 and 1900 of the principal products of minerals, metals and the more important manufactures thereof, illustrates the great development during the decade of the great basic industry of the nation:

	—CALENDAR YEAR—	
	1890.	1900.
Iron and steel and manufactures.....	\$ 27,000,134	\$129,788,236

Total minerals, metals and manufactures.....\$140,447,104 \$436,227,457

SOME deserved praise is being accorded the U. S. Corps of Engineers, which furnishes a high quality of service for the Government at less than commensurate value. The Corps of U. S. Engineers controls and directs a larger amount of money than any other Government bureau. It also has a larger number of employes, there being in the aggregate over 11,000 employes, though of that number less than 350 are engineers.

Federal Mining Law Amendments.

Senator Stewart of Nevada is trying to push a bill through Congress amending the U. S. mining laws. The bill provides, among other things:

That no person shall locate a mining claim as agent or by power of attorney for another, except as hereinafter provided. No person shall locate more than one placer mining claim in the watershed of any stream or creek in the same mining district, nor shall any person locate more than one claim on any vein or lode; provided, that any citizen of the United States or person who shall have declared his intention to become such may, after the discovery of ore in place in a lode or mineral vein in paying quantities in a placer deposit, locate one such claim for one other person as agent or attorney and no more in any one mining district; provided, further, that prior to any such location for another, he shall file for record in the recorder's office of the mining district a power of attorney authorizing him to make mining locations for the person named therein.

By reason of the fact that Stewart of Nevada was the author of the Federal Mining law of 1872, he has constantly arrogated to himself the adjustment of all matters in connection therewith, in which he has been sustained by what is known as "senatorial courtesy," which in this case means that miners are not supposed to know what they want, and that Stewart does know. Unfortunately, if he does, he refrains from evidence of such knowledge. He has steadily defeated every effort to get adequate and necessary amendment to the Federal Mining law.

Section 1 of his present proposed bill is open to serious objection. It means additional opportunity for extensive and expensive litigation such as now goes on under the ridiculous extralateral law. It is a menace to the miner, and should be beaten in the committee room. Were it to become a law a locator could be harassed even more than at present. A locator might locate claims one, two or three miles apart and, in case of developed value, the plea set up that they were on the same vein or lode.

Senator Stewart might even at this late day undo some of the mischief he has made by favoring necessary amendment to the Federal Mining law; and, if conscious of his own inability in that direction, he might graciously exercise his "senatorial courtesy" to the extent of letting some one else in Congress introduce so requisite a measure. It is possible that, out of 90 Senators and 357 Representatives, some one might be found sufficiently competent to draft and advocate such a bill.

If a bill were passed in the U. S. Congress repealing the "apex" and "extralateral" features of mining locations, making their limits vertical side and end lines, making all locations conform to legal subdivisions of U. S. surveys, obliging locators to complete \$500 worth of improvements and make application for patent within five years from date of location, and an amendment not allowing relocating of claims to avoid annual assessment work, there would be some resultant good to the real miner. The suggested amendments have long been advocated by legitimate mining interests.

THOS. LAWSON of Boston, the organizer and promoter of the Trinity Copper Co., of Shasta county, Cal., is quoted in Boston as saying: "No investment in gold or silver mining stock, the stock of a land company or an industrial based upon patents, is attended with so great a risk as an investment in the stock of a new copper mine. At least 499 in each 500 of the new copper mines whose stocks are offered for sale publicly are worthless, a large proportion of them being swindles of a most flagrant character, organized and conducted for the sole purpose of selling stock." This is strong language and not warranted by the facts. It might, perhaps, have been more conservative to have said 489, or even 479.

THE Secretary of the Interior has reversed a recent ruling of the General Land Office Commissioner concerning location of claims across claims previously patented. The latter had refused patent to a Gilpin county, Colo., company on the ground that part of their location lines were laid within or upon other patented lode claims. The Secretary holds that extralateral rights are oftentimes the most valuable rights obtained in a lode location; that exterior lines of a location are not in themselves property, but mere boundaries or instruments of description, and that the junior locator has the right, where necessary, to place end lines on other patented claims

Concentrates.

WITH acid ore lime has proved beneficial in gold mills.

LIQUID AIR has not been, nor is it likely to be, used in gold extraction.

THE chief restriction on the bromine recovery gold process is its cost.

COPPER taken up by ammonia solution can be most readily precipitated by iron.

A FEW DROPS of coal oil on the hands up to the wrists will greatly obviate the numbing effect of cold.

IN ditches and flumes in hydraulic mining the average loss by leakage is about 8% and by evaporation about 9%.

"ROCK IN PLACE" is any rock, mineralized or unmineralized, in the solid mass of the mountain, other than float.

METALS have no smell when entirely clean and untouched by the hands. Metals acquire no smell by being warmed.

PLATINIC CHLORIDE may be made by dissolving spongy or scrap platinum in aqua regia and evaporating to dryness by a gentle heat.

IF rigidly accurate in statement, there is no such thing as "wireless" telegraphy, as in the Marconi, Tesla and similar systems wire is used.

THE only American standard legally recognized by congressional action is the troy pound of the United States Mint, legalized in 1827.

TO PROPEL A BOAT 25 feet long, 5 feet beam, drawing 19 inches, 4 miles an hour, slack water, would require 4½ H. P. A knot equals 1.15 miles.

PLATINUM has the highest melting point of any metal used in electrical work, and with equal sized wires would carry the heaviest current without melting.

AN engine with a piston 14 inches in diameter, stroke 28 inches, speed 100 revolutions per minute, mean effective pressure 35 pounds, is developing 75 H. P.

QUICKSILVER as a chloride is rare. It is reported found in minute quantity at Idria, Austria, and Almaden, Spain, in connection with the sulphide. It is considered as a curiosity.

MINING MEN who are "moving around" can have the address of their paper changed at any time for any interval by notifying the business office of the present and intended address.

ACCORDING to the American system of standard weights a carat is 205 milligrammes, or three and two-thirtieths grains. A troy ounce would be 31,103 milligrammes, or 151.72 carats.

WHILE gold mining is the only business on earth in which there is no competition, the statement does not apply to the sale of mining shares in which there is at times considerable competition.

THE California State Mining Bureau is not an advertising medium but an educational institution, and has done some good work in that direction. It could do more if politics was kept out of it.

IN connection with the page article, "New Methods for the Extraction of Copper and Zinc," in the issue of Dec. 29, 1900, the address of the G. C. Collins referred to is 39 Broad street, New York City.

THE cost of producing an ounce of gold or silver in paying mines has nothing to do with the actual value of the product, which latter, in this respect, differs from any other branch of human industry.

IN the issue of the 26th ult. it was erroneously stated that "the deepest shaft in Victoria, Australia, is at Stawell, 2409 feet." The deepest shaft in that country is at Bendigo, Lawsell's 180 Mine, 3452 feet.

ONE cubic yard of hard rock will make 1.7 cubic yards embankment; one cubic yard embankment will require about .5882 cubic yard rock in place. One solid cubic yard rock in place will make 1.8 cubic yard when piled.

"AN OUNCE OF GOLD" is not definite in value. The latter depends upon the fineness of the gold; the ounce may be \$10 or \$20, according to its fineness. Where reported in "ounces fine," pure gold, it is worth \$20.67 per ounce.

TO OXIDIZE BRASS OR COPPER, immerse the articles in a solution of two ounces nitrate of iron and two ounces sodium hyposulphite to one pint of water until the desired shade of oxidation is acquired; then wash, dry and burnish.

THERE is a deposit of fuller's earth at Poso, 17 miles north of Bakersfield, Kern county, Cal., that is of commercial importance, being of high grade, suitable for filtering and bleaching purposes, etc., and partially developed.

THERE are several glaciers in the high Sierras in California, and glaciers are not uncommon in Colorado. In the latter State Hattlett's glacier is upon Hahn's Peak, in the northern part of the State, between Estes Park and Middle Park.

THE Colorado law of 1897 giving a mining tunnel a right of way through senior claims was declared unconstitutional in 1899. Tunnel companies projecting such work must secure right of way by agreement with owners of existing claims.

A CRUCIBLE ASSAY is considered to be the best for telluride ores—a not too hot fire and forty-five minutes in the furnace, sufficient being used to furnish a button of

about twenty-five grams, to be immediately cupelled at a low heat, crystals of litharge forming in the cupel.

THIS paper is always pleased to publish any improvement or account of successful operation in any department of mining or metallurgy for the general good. A great part of the value of such things is the publicity thus given, whereby all are benefited without loss to any one.

THE commercial ton cost of milling is that cost in which the decrease from the ton cost of milling with only technically unavoidable loss exceeds the technically avoidable loss per ton by an amount sufficient to cumulate a justifiable profit margin over the working cost of milling.

THE chief difference between syenite and granite is that the former has little or no quartz, and, hence, a considerably lower percentage of silica. Syenite was long a term for what is now usually styled hornblende granite. Syenite is not as abundant nor as widely distributed as granite.

GOLD AMALGAM may be liquid, pasty or solid, according to the proportion of gold therein and the purity of the amalgam. With 90% mercury the amalgam is liquid; with 87%, pasty, and at 85% mercury the amalgam crystallizes. True crystalline amalgam is Au, Hg. All retort gold contains at least .01% mercury.

A FAIR way to determine the cost of mining and milling ore per ton, after the mine and plant have been paid for is to divide the total tonnage mined and milled into the total costs; the yield per ton is the tonnage milled divided into the gross bullion product; the profit per ton is the difference between the cost and yield per ton.

THE leaser is a good man for the mine owner to listen to. In some cases he is the ideal developer. He has to be a miner; he can't be just an ordinary laborer who expects a miner's wages because he works in a mine, and if the owner can't work the mine himself or can't sell it, he might do worse than to give the leaser a chance at it.

IN the locality named in Mexico an arrastra would doubtless do good work, economically. Three 10-foot arrastras, tandem, with ore crushed to 10-mesh by rolls, ought to dispose of thirty tons every twenty-four hours. "How to build and operate an arrastra" was given at great length and complete diagrams and illustrations in the issues of Jan. 14-28, 1899.

IN northern Sonora, Mexico, the gold ore veins are chiefly in or closely associated with granitic and plutonic rock. In central and northern Arizona the same fact exists. The Congress, Arizona, vein to a depth of 400 feet traverses granitic rock in close association with a dike of plutonic rock. Near Indio, San Bernardino Co., Cal., the same conditions are noticeable.

THE theoretical horse power of a stream being 1000, its transmission as electricity 5 miles to mills would comprise a loss of about half in turbine, dynamo, wire, transformer and motor, even on the assumption that everything worked at concert pitch. Commercially pure aluminum at 35 cents per pound is about equal in cost for the same conductivity to copper at 17 cents.

WITH strict reference to accurate statement the term "tunnel" applies to a nearly horizontal passage through a hill or mountain, open at both ends, as a railroad tunnel. Ordinarily, however, the word is used instead of the term "adit," and is understood to mean a nearly horizontal passage from the surface through which a mining claim may be entered, worked or unwatered.

ANY State or territorial legislature can pass a law defining how many hours shall constitute a legal day's work in a mine or elsewhere, and the courts will, doubtless, hold such a law to be constitutional if of general application; but no legislature can enact a law that would hold regarding to rate or amount of wages. That must always be a matter to be settled by and between employer and employee.

EVERY vein runs in some general horizontal direction or course, which is called its "strike." The inclination or angle which the vein takes from a horizontal plane on the surface of the ground is called its "dip." The pay ore occurs in independent bodies in the vein and are called "ore chutes." The inclination which those bodies assume is called the "pitch of the chute." There is no limit to the length or number of chutes which may exist in a vein in any mine.

PROPERLY USED, a steel scraper for a copper plate in a stamp mill is a useful tool. Made from ½-inch steel, 3 inches wide, ground square across so as to give two right-angled edges, it will break through amalgam formed in hard scale and crack it off like so much dried putty, leaving the plate with a soft, shiny surface. It is particularly essential with some ores in connection with the inside plates where the scouring of the pulp seems to harden the amalgam.

ORDINARILY in California drift mining the timbering is kept close up to the working face. In place of running the caps from post to post with close lagging overhead, it is usual now to set a cap over a post T-shape, wedging it tightly to the roof, fewer posts and caps and less lagging being thus required. Where the roof is cemented, gravel or lava, posts alone, or posts and caps are employed. The cost of such timbering approximates 5 cents per ton carload.

CONCERNING the boiler explosion regarding which there was a full page illustration and extended comment in the issue of Jan. 26, it is learned that the coroner's jury declared that the accident was due to "the boiler

plant being of insufficient capacity and worked too hard." It is officially stated that the direct cause of the explosion was an old crack on the inner edge of one of the horizontal lap joints, partly between and partly outside the rivet holes.

ELECTRICITY is considered to be due to a vibration of the ether of space; light, heat and electricity are considered different forms of manifestation of the energy of ether vibration. A variety of experiments and observations have shown so intimate a connection between the phenomena known as "electricity" and "light" that most modern scientists consider the electro-magnetic theory of light to be the correct one.

FLUORSPAR is mostly used for melting iron in the cupola, in making open-hearth steel, as a flux in smelting, and in cleaning iron castings. The most of the United States product comes from Kentucky. It is worth about \$8 per ton at the mines. Limestone is generally used as a flux in a cupola furnace. It fluxes off the silica of sand adhering to the pig iron and scrap. It also takes up any silica produced by oxidation of the silicon in the iron and combines with the ash of the coke. A combination of fluorspar and limestone is often found to be of good result.

WHERE a mining claim is located for a stated width and length, and after the monuments have been fixed and described in the location notice, and the latter posted and recorded, it is found that less length or width than that claimed has been included within those monuments, they can be changed, or, if stakes, can be moved out, to get the claimed length and width—provided such additional ground is still subject to such location, and also provided that when such extension is made a new notice of location, describing the stakes or monuments as fixed by the change, is posted and recorded.

THE legal way for the owner of a mine giving a lease or working bond to protect himself and the mine from liability for material furnished or labor done thereon under the lease or bond is to conspicuously post notices, before such work is begun, that the work is to be done, under bond or lease, to So-and-So (naming the parties), and that the owner disclaims for himself and the mine all liability for cost of such work. He should also have in the bond or lease a distinct condition that the parties of the second part shall pay for all work and labor under such lease or bond, and that paper should be duly recorded.

A CHLORINATION PLANT operating four ovens should be able to work 500 tons concentrates per month. The average cost in California or Colorado would be about \$6.75 per ton. A fair extraction would be 90%. The relative merits of cyaniding and chlorination have been repeatedly discussed herein. What is best for the ore is the best process. It all depends on local conditions. A drum of liquid chlorine holds 115 pounds, and is equivalent to 972 pounds manganese, 1080 pounds salt and 2160 pounds sulphuric acid. The drum is 10 inches diameter, 5 feet long, and costs, laid down, from \$35 to \$45.

BRASS or copper pipe may be bent without flattening or breaking by being filled, while yet straight, with rosin that has been heated or melted until fused. After it has cooled and become solid again, the pipe may be bent into almost any desired shape. When bent as desired, heat the outside of the pipe until the rosin melts and runs out. With iron pipe the use of rosin is unnecessary. Heat the metal to a bright red; then from a squirt-can filled with cold water throw a fine stream on the inside of the bend, keeping it cool, while the outer part is still red hot. In this way the inner part is kept from breaking, while the outer part stretches and curves.

NECESSITY determines the amount of water required to run a 10-stamp mill. Where water is so plentiful that it makes no difference how much is used, there may be required 1½ miner's inches—about 840 gallons—per hour. In arid regions, where water is precious, a 10-stamp mill may be run on half that amount by the use of water-saving apparatus that recovers the water for reuse. Much, too, depends on the ore. Quartz can be worked on eighty gallons per stamp per hour; clayey ores will sometimes require 100 gallons per stamp per hour. In this economy of water in desert regions the gas engine engine also plays a prominent part.

IN Siberian placer mining the trough used consists of a rectangular box, open at the top and fitted at the bottom with a perforated iron plate, ½ to 1 inch holes. The dirt is shovelled into this box, and if the gold is fine, mercury, not exceeding ten parts to every one part of gold, is added. Water is then led or pumped in, and the fine material is washed down through the bottom screen plate and falls onto inclined tables of about 20 feet length by 20 inches width. These are provided with five rifles, of which the upper two are 2 inches high, and the others of less height. The disintegration of the material is completed on the tables by workmen using a small rake. When disintegration is finished, the stream of water is diminished; and, if the gold is fine, and mercury has not been previously added in the hopper, a little is now sprinkled on the sands, the raker meanwhile continuing to rabble the material accumulated behind the rifles, pushing the contents of the lower ones up the table again, until the contents are thoroughly cleansed. More water is then added, the pyrites washed away, the magnetite removed by a magnet, and the gold and amalgam collected. The black sands are treated over again with the next charge. The Siberian trough treats about 500 pounds of dirt at a time, or about five tons per day.

Questions and Answers.

I own eight mining claims in Kern county, Cal., all paid for. Want a U. S. patent; what will it cost? How will I go about it? I want to put on a first-class 20-stamp mill, with all modern requirements, with all appliances, complete. What will that cost? W.
Wilkesbarre, Penna.

In securing patent to a mineral claim, first send to the office of the Surveyor-General a certified copy of the location notice and \$35 for office fees. That office then authorizes the survey. The applicant makes the financial arrangements with the surveyor. The surveyor makes return to the Surveyor-General's office of his notes, etc., where the clerks plat the claim and check up the survey. They then send the applicant two copies of the plat and a copy of the field notes. One copy of the plat he posts up on the claim. The other he files at the land office and makes application to the register for a patent. The application is sent forward from the land office to the Commissioner of the General Land Office, and from this latter office the patent finally issues. The land costs \$5 per acre. Proof must be filed with the register of the land office that \$500 worth of labor has been performed for each claim. This proof must consist of a certificate from the U. S. Surveyor-General.

A 20-stamp mill will cost from \$25,000 to \$60,000, according to style and completeness. On page 188 of the issue of Aug. 18, 1900, is an illustrated description of a 40-stamp mill at Weaver, Arizona, completed Aug. 1st, that cost \$150,000.

Does the presence of foliated mica pockets 1x2x½ inch thick, in the surface rock, point toward the probability of the existence of larger pockets at greater depth? St. Paul, Minn. H.

Yes, is the answer to a question so qualifiedly worded. "Pockets" of mica, however, at any depth, are not susceptible of any great commercial development.

Men are making pins, watch charms, etc., from the enclosed, but no one here knows what it is. Is it not a gem of some kind? T.
White Hills, Ariz.

The handsome green rock is not hard enough for a gem. It is a massive pyrophyllite (an aluminous talc), and belongs to the serpentine-talc group.

At the present price of copper the smelters are paying \$2.70 per unit. Please explain how they figure the price. Solomonville, Ariz. S.

The unit of weight is 20 pounds=1% of copper in the ore. Suppose the ore carries 5% copper, or 100 pounds to the ton; the smelter, paying \$2.70 per unit, pays five times \$2.70—\$13.50 per 100 pounds of copper contained.

What is the enclosed mineral, and what is it worth? Visalia, Cal. J.

It is a graphitic mica schist, carrying no values.

What is the "assay ton system" you mentioned in your paper of Jan. 26 as having been invented by a New York assayer? M.
Redding, Cal.

It is nothing new, and is a well-known system of weights in general use by assayers. There are 29,166.6 troy ounces in one ton avoirdupois—2000 pounds; the "assay ton" contains 29,166.6 grams, so that if one assay ton of ore is taken for assay and the resulting button should weigh say ten milligrams, then the assay value of that ore is ten ounces per ton. One ounce per ton would be 0.00343%.

There are three of us who have a mining claim; my partners want to go ahead and develop; I don't want to keep on; I can't pay for my share of the work, and don't believe it worth developing anyhow. Can my two partners hold me liable for my share of the expenses? J.
Burke, Idaho.

No. You can quit whenever you feel like it, and can refuse to be responsible for any further expense of any kind in connection with the matter—provided you and the other co-partners have no special partnership agreement. Meanwhile, if your two companions go on with any work on the claim, they can advertise you out at the end of the year, and after such notice your interest therein becomes theirs.

I located a claim in July, 1899, but did no work on it. Now I want to work it, but am in doubt as to how to go ahead. S.
Republic, Wash.

Proceed as though it had never been located. Your location lapsed December 31, 1900, by failure to perfect claim. If no one else has located the claim since January 1, 1901, you have the same rights—no more, no less—that any one else has. But if others have legally located over your first location, you have lost all right thereto.

What is the enclosed specimen? I am assured it is to be had in this locality. T.
Bingham, Utah.

It is variscite, a green gem stone of value and exceedingly scarce in this country. If it can be found

at Bingham the matter is one of importance. Its presence seems, however, to be confined to the vicinity of Mercur, Utah.

In an article I find the words "artesian positive" and "phreatic" applied to water. I fail to see in what connection. L.
Bakersfield, Cal.

Presumably the article was on irrigation methods. As applied to wells, "artesian positive" means a well from which the water rises above the surface. "Phreatic" is technically a species of ordinary well supplied by percolation and absorption as distinct from artesian.

I made application for a patent some time ago, and now am told that I must keep on doing annual assessment work. How is this? W.
Baker City, Or.

You don't tell enough to afford ground for intelligent reply. If you made application for patent, pushed proceedings, and have paid your money, and can prove it by official receipts, you will get your patent all right, and, meanwhile, need do nothing further pending its receipt, which will forever exempt you from any further work or expense to prove title; but the mere filing of an application for patent does not suspend the obligation to keep up the required annual work. If the purchase money has not been paid and the application is allowed to sleep, the claim is open to relocation, unless you keep up the annual assessment work, and can prove that you have done so.

We want to save free gold by "sluicing," as you call it in California, and would like some few suggestions as to the custom in the States. L. T.
Wellington, New Zealand.

"L. T." would best buy some standard work thereon, like that of Bowie, Randall or Longridge. The saving of fine gold by sluicing is an art in itself, to be acquired only by study and practical experience. Assuming that the first principles of the science of gold sluicing are understood, it is then to be determined by local conditions as to individual requirements. In California success has been attained by shoveling the material into boxes 16 inches wide, 9 inches deep, set at a grade of 7 inches to every 12 feet, the bottoms gradually flaring, the last box being 32 inches wide, the shape spreading to throw the gravel, etc., so that the gold must touch the blanket riffles and there remain. At the bottom the water flows into a V-shaped trough, covered with fine wire gauze, the fine sand and gold carried at right angles from the box into a large tub, the coarse gold falling over outside. Riffles are of various shapes and materials, from steel to grain sacks. The question would require a volume for adequate answer.

Can slags from reverberatory furnaces, going 30% copper, be put through a blister furnace economically producing metallic copper? S.
Elizabethtown, N. M.

The question is a little confusing, unaccompanied by detailed statement. Usually in case of smelting of copper matte smelted by the reverberatory process, the "slag" containing copper is returned to the blister furnace, where it aids in the production of metallic copper. "Slags" from blister and matte smelting furnaces are susceptible of reduction in a cupola or blast furnace by use of iron pyrites, producing a secondary matte and slags practically free from copper. A smelting mixture of that kind for such furnace would be made up about as follows: Coke, 350 pounds; matte-smelting slag, 2500 pounds; blister-slag, 300 pounds; pyrites, 600 pounds; carbonate of lime, 400 pounds.

We have had a discussion as to the best drop for a stamp and agreed to leave it to you. I favor in a 5-stamp mill 1, 3, 5, 2, 4. K.
Placerville, Cal.

This is a case of "where doctors disagree." There is no standard; it is largely a matter of opinion. Every mill man has his own reasons for firm belief that the manner of drop in his mill is the best; 1, 3, 5, 2, 4 is good; so is the reverse order, 1, 4, 2, 5, 3. Some think 1, 5, 2, 4, 3 is about right; it makes uniform the splash of the water and pulp in the mortar; No. 1 dropping, sends the water through the battery lengthwise, which No. 5, in falling, catches and throws back; the same with No. 2, sending it back to No. 4 in its descent, No. 3 equalizing the swash. California mill men also use 3, 5, 1, 4, 2; 1, 5, 2, 4, 3; and 1, 3, 5, 2, 4. The 1, 4, 2, 5, 3 is probably as good as any. As noted, it spreads the pulp well. In a good splash a wave runs along the lower edge of the screen, moving backward and forward from end to end. A good wave motion starts from the center stamp; that latter start is thought by some to secure the greatest amount of discharge; others think that more crushing is done by first dropping the end ones. All seem to agree that in a 5-stamp battery no stamp should drop directly after the one next to it, one stamp at least intervening; the idea being that at the exact moment the stamp drops, the stamp on each side should be raised enough to allow the ore to be spread beneath, thus equalizing the splash and discharge through the screens. Some give the end stamps ½-inch to 1 inch more drop than the others, to prevent the pulp from

banking at the ends of the mortar. Then these end stamps will soonest strike the cams, preventing the others from being run at the higher speed that their shorter drop would otherwise allow. It is not unusual to find a mill man using end stamps heavier than the rest in a 5-stamp battery and allowing the same drop for all five, claiming good results in a fast-drop mill.

An oil company agent here assures me that the stock in that company can not be assessed, and that, if I buy stock, it can not in any way cost me any more. Is that right? O.
Los Angeles, Cal.

No California corporation stock is non-assessable. Any stock in any California company is liable to assessment. It does not follow that it will be assessed, but there can be no legal assurance that it is non-assessable.

What is the "miners' ton," and where is it in use? I see mention of it; but we know nothing of it here. T.
Deadwood, S. D.

It is a form of weight still in use in Great Britain and on the Continent, where ores and mattes are sometimes sold by the "miners' ton," which consists of 21 cwt., of 112 pounds each, or 2352 pounds.

What is the best record of use of cyanide? We hear of solutions running from eight ounces to two pounds per ton. L.
Eureka, Utah.

It would be impossible to give the "best" record; probably what is wanted is statement as to the smallest amount used. At the Mercur, Utah, ten ounces per ton of ore treated is used; at the Daisy, Utah, four ounces per ton; at the Sacramento, Utah, 5½ ounces per ton. The range is a wide one, running from 3½ ounces to five pounds per ton. The matter is one of local requirement, though proficiency in cyanide practice usually lessens the amount required to the minimum.

I have four locations, and want to know if I can not get a patent by proving that \$500 worth of work was done on one of them. They are all adjoining, and what is done on any one of them develops all four. I know of men who have got a patent for three adjoining claims by doing \$500 worth of work on one of them. The rule ought to work for four. S.
Randsburg, Cal.

You must show \$2000 worth of work done before you can get a U. S. patent. The \$2000 means \$500 for each one of the four claims. If they are adjoining and owned in common, and the work done on one tends to develop all four, then the whole \$2000 can be spent on any one of them for all. Up to July 1, 1898, the holder of adjoining claims could do \$500 worth of work on any one of them, if such work tended to develop all, and get a patent for all of them that way; but since that date, in the case of adjoining contiguous claims, there must be \$500 worth of work done for each claim before the owner can get a U. S. patent. Doubtless, in the case you cite, where the owner got a U. S. patent for three adjoining claims by doing \$500 worth of work on one of them, application was made before June 30, 1898.

A says there is a tax on the issue of certificates of stock in stock corporations, for the benefit of the Mining Bureau. B says there is not. Which is right? P.
Los Angeles, Cal.

B. That is, if California is meant. There was such a California statute, but it was repealed by the Legislature four years ago.

What is meant in one of your recent issues by "dore bullion," and "wet" and "dry" ore? Columbus, Ohio.

"Dore bullion" is silver bullion containing a small percentage of gold. "Wet" ore is a smelter term for ore containing a high percentage of lead or copper. If an ore carries less than 5% of either of these metals, it is a "dry" ore.

How can I best assay a quicksilver ore that I think contains 1% mercury, but carries arsenic too? G.
Calistoga, Cal.

It might be mixed with about five times its weight of litharge, and, heated in a retort, there would result a semi-liquid mass, which would be sulphuret of arsenic, and cinnabar, the latter decomposed into sulphurous acid and metallic mercury. With a moderate heat the quicksilver would be entirely volatilized, and would collect in the condensing apparatus and the farther part of the neck of the retort. Care would be necessary to very gradually and gently heat the retort to the required temperature, lest it be perforated by the effects of the litharge before the complete volatilization and condensation of the quick.

Suppose that I have a placer claim patented, and a man comes along and starts to locate a quartz lode claim within its limits, have I no redress? Breckenridge, Colo.

That depends; you do not state all the facts; in any case, you have certain rights. If your placer claim patent was applied for before the other man located the lode claim, he has no standing at all. If, however, he made discovery and legally located a

lode claim within the limits of your placer claim before you made application for patent therefor, he would have superior rights to you, and the placer location to the extent of his lode claim would have to yield thereto.

I enclose two problems which have puzzled our best figurers. Would like to have them solved:

No. 1. If A B C be one acre of land enclosed by three equal circles, what is the diameter of each circle?

No. 2. I have a house in one end of the triangle and my friend a house in the other. How far on the perpendicular from the base should we put our line fence to give each of us an equal acreage?
Washington, Nevada Co., Cal.

Answer to No. 1. Let $2X$ = required diameter, when X = radius. Let N, O, P, be the centers of the three circles. Then the triangle formed by joining these points will be equilateral, each side being equal to $2X$.

$ABC = NOP - (OCA + CPB + ABN) = 160$ square rods.

$OCA = CPB = ABN$.

Area of $NOP = CP \times NC = X \sqrt{3} X^2$.

Area of $OAC = \frac{1}{2}$ area of circle with radius X .

Area of $OAC = \frac{1}{2} X^2 3.1416$.

$\therefore X \sqrt{3} X^2 - \frac{3}{2} X^2 3.1416 = 160$ square rods, 1 acre.

$X^2 \sqrt{3} - 1.5708 X^2 = 160$ square rods.

$1.7321 X^2 - 1.5708 X^2 = 160$ square rods.

$\therefore .1613 X^2 = 160$.

$X^2 = 991.94$.

$X = 31.4$.

$2X = 62.8$.

$\therefore$ diameter of circle = 62.8 rods.

Answer to No. 2. CH , the perpendicular to the base = $\sqrt{1000^2 - 250^2} = 968.24$. Similar triangles have the same ratio as the squares of their corresponding sides.

AHC is similar to DKC . But as DKC is equal

to one-half DEC , which is itself one-half of ABC , and as AHC is also one-half of ABC , then the ratio of AHC to DKC is 2 to 1.

$\therefore CH^2 : CK^2 = 2 : 1$.

or $968.24^2 : X^2 = 2 : 1$.

$2 X^2 = 937,500$.

$X^2 = 468,750$.

$X = 684.602$.

$\therefore$ the distance $KH = 968.24 - 684.602 = 283.638$ feet.

$\therefore$ the division fence is placed 283.638 feet on the perpendicular from the base.

I have asked for information concerning how the unit of weight is fixed and the method of quoting prices on ore, and the enclosed has been supplied by the journal asked. I do not understand it, and ask your opinion as to its accuracy:

"The unit of weight is 20 pounds avoirdupois. It is 1% of copper in the ore, and 1% of a ton—2000 pounds—is 20 pounds. Each per cent of copper contained in the ore is equal to as many units. Ore carrying 50% of copper (or fifty units)—if copper, for example, is quoted at \$4 per 100 pounds—is worth 60 cents per unit, and fifty times sixty equals \$30 a ton. For each decline or rise of 5 cents in the quotation a deduction or addition of 1% should be made. If the quotation is \$3.95, then 1% from the price (60 cents) should be taken, making 59 cents the settlement price, and so on down to whatever the quotation may be. If the ore is quoted for example, at \$3.75, 5 cents from 60 leaves 55 cents per unit, and ore carrying 50% of copper would amount to fifty times fifty-five, equaling in value \$27.50 per ton."

Denver, Colo.

I.

The question you ask lacks definiteness. You do not state to what unit of weight you refer, nor whether it is the quoted price of copper or lead. As to giving an opinion on the quoted answer you got from some other journal, we hesitate to make comment, as such is contrary to our usual custom, it usually taking all our time and effort to guard against mistakes—leaving none for noticing those of others. However, concerning the answer you state was furnished you, it has been floating around for several months. It originally appeared in an Eastern journal. The writer was evidently mixed in his illustration, as it applies to the Colorado method of quoting prices on lead ores. The price of copper, as you know, is about 17 cents per pound, and therefore it seems a mistake, in illustrating the method of figuring, to take a price as low as 4 cents, though the fact that he took 4 cents as a basis indicates that he was illustrating the method in which lead was figured rather than copper. He is also mistaken in his figures wherein he states "if copper is quoted at \$4 per 100 pounds it is worth 60 cents per unit." As a unit is one-fifth of 100 pounds, a unit, or 20 pounds, would be worth 80 cents, instead of 60 cents. If copper were worth \$17 per 100 pounds, and the price should drop to \$16.95, this would make naturally a shrinkage in the price per unit of 1 cent, as every drop of 5 cents per 100 pounds would be equal to a drop of 1 cent for each unit, or 20 pounds. As a fact, however, copper usually fluctuates to the extent of $\frac{1}{4}$ or $\frac{1}{2}$ cent per pound, and we do not recollect having seen any quotations for copper per unit in less multiples than 5. That is, a change in the quotation would hardly be made unless copper had changed to the extent of 25 cents per 100 pounds, which would then make a change of 5 cents per unit. Lead, being a cheaper metal, fluctuates from $2\frac{1}{2}$ to 5 cents per 100 pounds, and consequently the price per unit is changed for every change of 5 cents per 100 pounds.

In the issue of December 29, page 607, is a process of reducing copper and zinc ores. I have made some tests on it, but not entirely successful. I used sodium sulphate, sulphuric acid and water, in the proportions suggested, and made a solution of 5%. How much copper should such solution dissolve? Will this solution dissolve ores of copper and zinc, or copper alone and zinc alone?

Pelton, Texas.

It is impossible to tell what quantity of the solvent, as indicated in the article, will be required in each individual case, since this must necessarily depend upon the nature of the copper-zinc ore treated. But a simple test consists in covering a weighed quantity of the powdered ore, whose copper and zinc contents are known by chemical test, with the solvent in an appropriate vessel, drawing off the solution after standing for twelve hours, washing the leached residue with water, drying the same, and

having it analyzed again for the copper and zinc percentages remaining. Results obtained in this manner will show whether the leaching was partial or perfect, and what remains to be done. The solvent dissolves the copper and zinc present simultaneously, so that a mixture of copper and zinc salts in solution results. If there is no zinc present in the ore, the copper will be dissolved; and in case there is no copper, the zinc values will be extracted. Gold and silver values, eventually present, must be looked for in the residue.

Could you give me any information in your particularly up-to-date paper as to the following points: In a sulphide copper ore, what is generally meant by the words "self-fluxing"—that is, what proportion of Cu, Fe, Ca, Au, Al may be called perfect fluxing ore? Are the proportions always fixed, and do the fluxes added have to be so proportioned as to bring the mixture up to some definite percentage? How would you class the accompanying analyses:

	No. 1.	No. 2.	No. 3.
Silica	43	75	60
Iron.....	12	6	6
Alumina.....	16	1	3
Lime.....	4	9	10
Sulphur.....	6	3	5
Magnesia.....	6	2	8
Copper.....	10	4	9

Princeton, B. C.

S.

By the expression "self-fluxing ore" is meant ore that contains all the necessary ingredients to make a clean slag without adding any fluxes to the charge. The question as to what would be the percentage of copper, iron, lime, silica, alumina necessary to constitute a fluxing ore is too broad a one to be answered in a few words. It depends upon what style of furnace is to be used, and what kind of slag it has been decided upon to make. All three analyses submitted by our correspondent, marked 1, 2 and 3, are too high in silica to be termed self-fluxing ores. Even No. 1, which is the lowest in silica, will need the addition of iron if reverberatory furnaces are to be used for smelting, and iron and lime in case blast furnaces are decided upon. Nos. 2 and 3 will need a great deal more of fluxes in the shape of iron and lime than No. 1, and if these fluxes do not contain any metal values in the shape of copper, silver or gold, and can not be had at reasonable price, it is a hopeless case to do anything by smelting, at least as far as Nos. 2 and 3 samples are concerned. Possibly our correspondent could improve his ore by concentrating. This means eliminating a certain amount of silica and leaving the concentrates in such a shape that the iron would be enriched. If a part of the silica is eliminated, it would give a self-fluxing ore for either reverberatory or blast furnace work.

A variety of other questions are answered, as usual, in "Concentrates" on page 81.

Capacity Lost by Air Compressors Working at Different Heights Above Sea Level.

The altitude above sea level at which an air compressor is to operate is an important point, the air being less dense at an elevation than at the sea level. When working at an elevation the compressor takes in less air at each revolution than at a lower level, its capacity is diminished, and there is a corresponding reduction in the power required to operate it. Following is a table showing the efficiency and loss in capacity of compressors working at different altitudes. It is computed for air compressors delivering air at sixty pounds pressure per square inch.

Altitude above sea level, feet.	Barometer, inches.	Efficiency of compressor, per cent.	Loss, per cent.
0	30.00	100.0	0.0
500	29.42	98.4	1.6
1,000	28.85	96.9	3.1

A Water Wheel Record.

The motive power in the Kinkead mill is furnished by a Pelton water wheel 18 inches in diameter, running under a pressure of 200 pounds to the square inch and using 12 miners' inches of water in twenty-four hours, which develops 15 H. P. The wheel makes 1000 revolutions per minute, which gives a periphery speed of 4500 feet per minute, equal to 1227 miles in twenty-four hours. As the wheel has been running almost constantly for five years, the buckets have traveled over 2,000,000 miles. The belt on the wheel travels 1000 feet per minute, or 272 miles per day, and has traveled during the five years about 500,000 miles. While the belt has been renewed six times during the five years, the shaft on the wheel has been renewed only once, and the buckets have never been replaced. During the five years the little wheel has furnished the power to crush over 60,000 tons of ore. The wheel only cost \$125 originally and the repairs on it for five years did not exceed \$10.—Enterprise, Virginia, Nev.

Commendatory Comment.

"We are advertised by our loving friends."—Shakespeare.

During Dec., 1900, and Jan., 1901, this paper has been even more than ordinarily favored by kindly comment and personal expression of good will. Fortunately, indeed, is the paper that after forty years finds favor in an ever-widening circle of readers who are pleased to commend its efforts to be useful. Its columns weekly speak for themselves, but it may not be deemed out of place to publish a very few of the multitude of kindly little messages received during the last sixty days. They are samples of what is constantly received and cordially appreciated.

"Send me two copies for 1901; the one I have been getting is always worn out by being passed around among the others. I want to file it," writes a Leadville, Colo., mine manager.

"What I like particularly about your paper is its absolute reliability," says a Globe, Arizona, subscriber.

"I want your paper most of all for its advertisements," is the statement of a Roseland, B. C., reader.

"I would just as soon pay you \$10 a year as \$3. I think it is the best mining paper published, and I get them all," writes a Victor, Colorado, mine operator.

"THE MINING AND SCIENTIFIC PRESS has the real mining flavor, and every one here likes it," comments a Wardner, Idaho, patron.

"I regard your paper as the best and most useful investment I make. I appreciate its high standard and constant reliability," writes an Ashland, Oregon, reader.

"Were the money made and saved by the MINING AND SCIENTIFIC PRESS for the mining industry of the country put together, it would pay the national debt," is the opinion of a Chicago, Ill., mining engineer.

"I enclose renewal of my subscription for 1901 for the best mining paper in the world," writes a Seattle, Wash., metallurgist.

"I find your paper absolutely indispensable to me," says a Denver, Colo., assayer.

"Every issue is worth all that I pay for it for a whole year," is stated by a Plymouth, Luzerne Co., Pennsylvania subscriber.

"You always seem to have just what we want," writes an Elizabethtown, New Mexico, reader.

"My San Francisco representative will call for the two missing numbers. I can not afford to lose from my file a single copy of so valuable a paper," says a mining engineer writing from Buenos Ayres, Argentine Republic, South America.

"You know I am not given to praise, but will say that your issue of Jan. 5th has more matter of live and vital information to the practical mining engineer than any other similar amount of printing that has come under my observation," is quoted from a letter sent us by a mining man of national fame, writing from Boston, Mass.

"Nothing can supply the place of the MINING AND SCIENTIFIC PRESS. We consider it an absolute necessity," says a Kalgoorlie, West Australia, mine manager.

"When we want to know anything about mining or settle any question, we always have a reliable friend in your paper," says a Sutter Creek, Cal., mine superintendent.

"Yours is a particularly valuable paper to us here, and I admire it," asserts a Princeton, B. C., subscriber.

"I know of no publication that has done more for the mining industry," says a foremost mine manager of Aspen, Colo.

"The position I hold and the salary I draw are mainly due to reading your excellent paper," writes a Coeur d'Alene, Idaho, mine superintendent.

"I have noticed that your paper is never afraid to tell the truth, and that it always stands by the miner in any capacity," comments a Juneau, Alaska, miner.

"Through the years your paper has been an inspiration and a help to me," writes a Clear Creek Co., Colo., millman.

"I move around so much I find it difficult to be a regular subscriber, but wherever I go I find the paper, and have a big scrap book full of good things cut from the copies I constantly buy," says a Florence, Colorado, mine agent.

"Yours is the best for the mining men. It's reliable, and isn't afraid of anybody," writes a Denver, Colorado, mine manager.

"As a mining engineer, I hold in high appreciation your technical articles, and find an up-to-date air about the paper that makes it valuable here to every mining engineer," says a Roseland, B. C., mining engineer.

"Every prospector I met in my tour through this country last season had a copy of the latest issue procurable of the MINING AND SCIENTIFIC PRESS," writes a Sumpter, Oregon, mining man.

"I value the paper chiefly for the hints and points so useful in my daily business," says a San Francisco electrician.

"I have taken to filing the paper. I used to cut out the good things, but I often found something on the other side equally good that I had cut into, so now I file all the copies and preserve the index," is the experience of a Deer Lodge, Montana, mine superintendent.

An entire issue could be filled with similar brief extracts from letters written by practical men in every department of mining and metallurgy, expressing high regard and personal friendship for the paper.

The season is a forward one. Ordinarily the California chicken with a \$2.50 gold nugget in its crop is reported from Yreka about Feb. 10th. This year Alameda county reports first, two weeks ahead, and with a diamond found in the crop of the defunct fowl.

Mining and Geological Terms.

It is customary in reports of mining cases and in mention of mining properties to use words that are not often plain to the non-technical reader, and as there are some mining men who do not wholly grasp the meaning of some such terms, the accepted definition of a few is given herewith. The following is not intended as a "glossary," nor as an exact technical definition in precise accord with all authorities, but may lighten the steps of some one as he stumbles along the rocky path of mining terms:

Augite—A kind of basalt or greenstone found chiefly in eruptive rocks.

Apex—The top or summit of a vein or lode.

Borate—A rather brittle, sweetish alkaline mineral.

Breccia—Rock composed of angular as distinguished from rounded fragments, closely cemented together with lime, oxide of iron, etc. There are quartzite, volcanic and bone breccias.

Breast—The face of an ore body at which a miner is working.

Bath oolite—A shelly limestone much celebrated as a building stone.

Bifurcation—Division in two prongs or parts.

Bornite—A brittle mineral occurring massive, granular or compact, containing copper, sulphur and iron. It is a valuable copper ore found in this and almost every country where copper ore exists. It is also called "horseflesh ore."

Chalcocite—A mineral of a lead-gray color, tarnished with blue or green, containing sulphur, copper and iron.

Chalcopyrite—A sulphide of copper containing sulphur and iron of a brass-yellow color.

Contact—Close union or junction of one ore body with another.

Crosscut—A drift from a shaft to intersect a vein of ore.

Country rock—The strata in which a metallic lode is found.

Collar—When speaking of the collar of a shaft: The curbing around a shaft to keep loose ground from falling in.

Cerussite—A mineral of a white, gray or grayish-black color, sometimes tinged with blue or green by some of the salts of copper.

Drift—A passage in a mine, horizontal or nearly so, forming a road for the extraction of ore or for carrying off the water.

Dip—The inclination or pitch of a vein or stratum. The angle with the horizontal is the amount of dip.

Dyke—A bank of hard rock by which lodes are frequently divided.

Drag—Material which has been displaced by the faulting movement of a large body.

Diorite—A granite-like rock, grayish-white to nearly black in color. It derives its name from being unmistakable or clearly defined.

Fissure—A crack in the strata produced by volcanic or earthquake action or subsidence. Most fissures are filled from below and become metallic or other mineral veins.

Ferrous—Anything having a considerable quantity of iron in its composition, as "ferro-manganese."

Fault—The sudden interception of the continuity of strata, until then upon the same plane, this being accompanied by a crack or fissure varying in width from a mere line to several feet, and generally filled with broken stone, clay or similar material. There are faults in some sections of which the horizontal extent is 30 miles or more and the vertical displacement varying from 600 to 3000 feet.

Foot wall—The side of the rock under a mineral vein; the underlying wall.

Felspar or feldspar—A genus of minerals rather than a single mineral.

Gangue—The mineral matters in which metallic ores are embedded.

Granitic—Pertaining to or of the nature of granite.

Horse—A mass of earthy matter intervening between the branches of a vein. The vein straddling on each side of a non-mineral rock is said to take horse.

Hanging wall—The overhanging side of an inclined vein.

Hornblende—One of the five most abundant simple minerals of which rocks are composed, the others being felspar, quartz, mica and carbonate of lime.

Infiltration—The process of filtering in or penetrating the interstices of rock or other matter.

Kaolin—Found in granite; generally arising from decomposition of the felspar.

Monzonite—A light grayish-green compact mineral, resembling hornstone.

Monoclinic—Having one single dip, persistent for a considerable distance.

Muscovite—A variety of mica. It is the most abundant of the micas and is a constituent of many rocks, notably granite, gneiss and mica schist.

Oxide—The product of the combination of oxygen with any metal. For instance, oxidized silver is silver on the surface of which a thin film of the black oxide has been formed.

Pseudo-morphism—The process by which one mineral replaces another.

Pyrites—An uneven, brittle mineral that strikes

fire when struck with a hammer, occurring frequently crystallized.

Selvage—An edge so woven as to prevent raveling or a woven border of close rock; used in a mining sense as the outer lining of a vein or fissure to its contact with another body.

Sphalerite—The same as blende. It is used by few mineralogists, and relates to a treacherous character of rock.

Sulphide—A neutral salt of sulphydric acid.

Titanite—A mineral occurring mostly in crystals, rarely massive.

Triclinic—A term applied to one of the six systems of crystals which has no plane of symmetry.

Triturate—To rub down to a very fine powder, finer than that produced by pulverization.

Electrolytic Refining.*

In the electrolytic parting of silver and gold, it is not necessary to obtain the deposited metal in sheet form, as silver in crystals is readily melted into bars. Owing to the great value of the metals treated, the chief aim is to secure a rapid output. As high current density is therefore employed as is possible without unduly heating the electrolyte or carrying over impurities from the anode. Short circuits produced by the bridging over of silver crystals from cathode to anode, when high current densities are used, can be avoided by scraping off the silver crystals.

The old Moebius process, in use at Pittsburgh, Pa., and Perth Amboy, N. J., and in which a fixed cathode is employed, is distinguished from the Moebius continuous band process, now used at the Globe smelter of Denver, Colo., and characterized by a moving silver cathode band. A few years ago Gustav Nebel, formerly an assistant to Dr. Moebius, discovered that oil will prevent the close adherence of the electrolytically deposited silver crystals to the belt, which fact has been successfully applied by Mr. Nebel to the band process as employed in the new Globe refinery.

Another important improvement made in the latter mentioned plant was the replacement of the platinum electric contact points, formerly employed, by the both cheaper and better conducting contact points of silver and the recognition of the necessity of removing the silver belts from the electrolyte when not in use to avoid their gradual solution.

The cost of parting dore silver by the Moebius electrolytic process, with careful management, should not exceed 20 to 30 cents per 100 ounces.

Regarding the electrolytic refining of gold bullion, experiments were made at the Philadelphia Mint during the past year, with the Wohlwill process, in use since 1880 or thereabouts at the Norddeutsche Affinerie at Hamburg, Germany, leading to the adoption of this process by the United States Government. The Wohlwill method of producing chemical pure gold by electrolysis, and slightly modified by Dr. D. K. Tuttle and H. J. Schlaeker, will be installed at the new Philadelphia Mint. Thus far about 2000 pounds of gold bullion have been electrolytically refined at the old Mint in Philadelphia, and, beside the pure gold, platinum and other metals of the platinum group were recovered as by-products.

The chief feature of the Emil Wohlwill process is the addition of hydrochloric acid or sodium chloride to an electrolyte of gold chloride, so as to prevent or at least diminish the evolution of chlorine at the anode and the consequent impoverishment of the gold contents of the solution electrolyzed. In this respect there is an essential departure in the behavior of gold from that of copper and silver under like conditions.

Wohlwill has demonstrated that it is practical and profitable to continuously purify impure gold and gold alloys by employing comparatively weak solutions of gold chloride and electric currents of a density as high as 100 amperes per square foot and even higher, through the combined influence of higher temperature and added hydrochloric acid.

The electrolyte used is a solution containing about 25 to 30 grammes of gold per litre, and maintained at a temperature of about 60° to 70° Centigrade, with about 20 to 50 cubic centimetres, according to the current density, of fuming hydrochloric acid with a specific gravity of 1.19, or instead 21 grammes or more of sodium chloride or common salt per litre.

When sodium chloride is employed, the amount of the compound added should in every case be limited to 100 grammes per litre of electrolyte, as otherwise the silver chloride present would be dissolved in the alkaline chloride and be deposited at the cathode with the gold, thus defeating the object in view. Therefore the amount of sodium chloride in the solution is restricted to that which will suffice to bind the chlorine evolved at the cathode.

As Dr. Wohlwill states, when the temperature of the electrolyte and the quantity of hydrochloric acid (or salt) therein are in proper accord with the density of the electric current, the anode gold, platinum, palladium and the bulk of the foreign constituents of the anode will pass into the electrolyte under the influence of the electric current. The major portion of the iridium and other metals of the platinum group remain undissolved, and with these the silver is separated as solid silver chloride. Similarly, a portion of

*Titus Ulke, in Electrical Review (condensed).

the lead is separated in the form of lead chloride as soon as the electrolyte becomes saturated therewith, or nearly so while the bismuth is separated in the form of an aychloride, should the amount of hydrochloric acid present be insufficient to keep it dissolved. The above-described insoluble mud, which separates and readily drops off the anode in small quantities at a time, also contains a very small amount of anode scrap and gold, forming about 10% of the weight of the anode in an extremely fine state of division. The presence of this gold is due to the fact that a portion of the anode gold is at once converted into protochloride instead of normal chloride, and the protochloride immediately after formation is decomposed into normal chloride and finely divided gold.

While, as described, a portion of the anode constituents passes over into the solution and another portion subsides in the form of an insoluble deposit, pure gold is exclusively deposited at the cathode, even from solutions of constantly increasing impurity and with currents of a density of 100 amperes per square foot. The gold extracted from the electrolyte at the cathode is therefore constantly replaced, chiefly by gold dissolved at the anode, and in part by equivalent quantities of other metals; but as the quantity of gold deposited at the cathode corresponds in part with the quantity of silver, lead and bismuth converted into solid chlorides, there is a gradual impoverishment of the electrolyte in gold, which is replaced by the addition of a sufficient quantity of gold chloride.

The simultaneous accumulation of foreign constituents in the electrolyte does not affect the purity of the gold deposited, even if there is an excess of such impurities, so long as the proper amount of gold is present in the electrolyte. In fact, the presence of these foreign constituents is even advantageous to the deposition of pure gold at the cathode, because the compactness of the deposit, which is very bulky from pure solutions (especially when currents of high density are employed), increases with an increase in the impurities in the electrolyte without affecting the purity of the deposited gold.

The above-described method of extracting gold permits the recovery (from large quantities of anode materials) of the comparatively small percentage of platinum contained therein, which after the precipitation of the gold may be directly recovered in the form of ammonio-platinic chloride.

Miner and Metallurgical Patents.

Patents Issued January 29, 1901.

Written for the MINING AND SCIENTIFIC PRESS.

ORE WASHING AND CONCENTRATING MACHINE.—No. 666,796; C. Brash, Victoria, B. C.

An ore washing and concentrating machine, suspended receptacle for receiving water and ore, provided with outlet extending below bottom of receptacle, combined with suitable eccentrics, rod operated thereby, ring upon end of rod encircling outlet extending below bottom of receptacle, suitable curved spring placed inside of ring, means for operating eccentric.

CRUSHING ROLL.—No. 666,892; P. Argall, Denver, Colo.

Unslotted frame mounted on main frame, horizontally movable thereon, pair of roll shafts and rolls revolvably mounted in suitable bearings, one on main frame, other on movable U-shaped frame, driving pulleys fixed on both ends of each roll shaft, outside beams, thrust collars splined on shafts between beams and pulleys, rotating with main shafts but

longitudinally adjustable thereon, screw bolts passing through fixed pulleys abutting against thrust collars, whereby latter are adjusted, springs for drawing movable roll toward fixed roll, means for simultaneously driving pulleys and rolls in opposite directions.

CONVEYER.—No. 666,865; E. Helfensteller, Jr., St. Louis, Mo.

In conveyor, combination with driven shafts, of oppositely placed cams arranged thereon, cam blocks riding upon each cam, conveyor bars extending from one cam block to next, having one member engage cam to prevent lateral displacement of parts, loose connections between cam block and conveyor bars to accommodate expansion and contraction of parts.

FLUE DUST CONDENSER.—No. 666,978; P. Bruschi, Argentine, Kansas.

Apparatus for condensing flue dust, cooling device having narrow chambers for passage of fumes, spaced apart to form circulating air spaces between them, mixing device connected therewith into which pass fumes from cooling device for equalizing temperature of fumes, suction fan connected with mixing device, cooling precipitating cylinders, each connected with discharge pipe leading from fan, each having circular water-jacketed channel into which opens discharge pipe from fan, water-jacketed discharge pipe into which opens channel for carrying off exhaust gases, valved discharge hoppers for receiving solid matter from channel and discharge pipe.

APPARATUS FOR BURNING PULVERIZED FUEL.—No. 666,862; G. S. Emerick, Philadelphia, Pa.

Apparatus for combustion of pulverized fuel, of grinding mill for reducing fuel to powdered form, aspirating centrifugal separator for separating finer from coarser particles of powdered mass, discharge

pipe for delivering lighter separated particles into furnace, feed regulator disposed between separator and discharge pipe, means for generating air blast in discharge pipe, aspirating centrifugal separator located above feed regulator, slight lift of fine particles necessary to effect separation, particles passing by gravity to feed regulator, thence to discharge pipe.

DRILL.—No. 666,818; J. H. Redfield, Bossburg, Wash.

Drilling machine, combination drill frame, reciprocatory rod therein, shaft for operating rod having clutch member, sleeve rotatably mounted on shaft, means for holding it from longitudinal movement thereon, second clutch member mounted on shaft, means for holding it normally and yieldably against first clutch member, second sleeve inclosing first sleeve at outer end having lug, split sleeve encircling first two sleeves, split sleeve having flange engaging peripheral groove in hub of second clutch member having cam for engagement with lug of second sleeve to move split sleeve and therewith second clutch member outwardly from operative engagement, means for operating split sleeve to operatively engage lug and cam, bearing sustained by second sleeve, shaft in bearing having bevel gear on second clutch member engaging first gear.

PROTECTOR AND SHAKER FOR RECHARGING CRUCIBLES.—No. 667,131; J. Illingworth, Newark, N. J.

Improved pot shaking device, comprising engine cylinder shaking jaws, hinged together, reciprocating piston at one end working in cylinder, at opposite end having jaws loosely coupled thereto, coupling means connecting piston and jaws.

Pebbles at Considerable Depth.

TO THE EDITOR:—In your Oct. 13th issue I noticed an extract from the Georgetown, Colo., Courier on "Boulders in Mines," in which the maximum depth at which they have been found is stated to be 500 feet.

In this mine I have found small water-worn pebbles at a depth of 1150 feet from the surface.

C. H. MACNUTT.

Pulacayo, Bolivia, S. A., Dec. 7, 1900.

At Constable Hook, N. J., the U. S. Government is building the tallest chimney in America. An excavation of 20 feet deep and 45 feet square has been made to hard gravel, filled with piles closely driven and upon the platform a base of fireproof brick 30 feet square by 30 feet in height built; on the base a round chimney of brick is to be built up to a total height of 360 feet. The stack is to be 10 feet in diameter at the top and will weigh 20,000 tons. The cost will be about \$50,000.

THE New South Wales Government offers £500 to the first exploiter who produces 50,000 pounds of the metal mercury from cinnabar in that colony; the offer to hold good till 1906. The New Zealand Government has offered a premium of 4d. per pound on the first 100,000 pounds of mercury produced, a third of which quantity must be manufactured previous to March 31, 1903, the remainder before March 31, 1904.

THE Pupin invention does not do away with the necessity for the use of copper for telephone wire, but may increase the demand for copper. It will reduce the cost of equipment of telephone plants, but this very reduction will lead to more extensive installment of telephone plants. The report that Pupin's apparatus will make it possible to use steel or iron wire instead of copper is unfounded.

Commendatory Comment.

"We are advertised by our loving friends."—Shakespeare.

During Dec., 1900, and Jan., 1901, this paper has been even more than ordinarily favored by kindly comment and personal expression of good will. fire when struck with a hammer, occurring frequently crystallized.

Selva—An edge so woven as to prevent raveling or a woven border of close rock; used in a mining sense as the outer lining of a vein or fissure at its contact with another body.

Sphalerite—The same as blende. It is used by few mineralogists, and relates to a treacherous character of rock.

Sulphide—A neutral salt of sulphydric acid.

Titanite—A mineral occurring mostly in crystals, rarely massive.

Triclinic—A term applied to one of the six systems of crystals which has no plane of symmetry.

Triturate—To rub down to a very fine powder, finer than that produced by pulverization.

Electrolytic Refining.*

In the electrolytic parting of silver and gold it is not necessary to obtain the deposited metal in sheet form, as silver in crystals is readily melted into bars. Owing to the great value of the metals treated, the chief aim is to secure a rapid output. As high a current density is therefore employed as is possible without unduly heating the electrolyte or carrying over impurities from the anode. Short circuits produced by the bridging over of silver crystals from cathode to anode, when high current densities are used, can be avoided by scraping off the silver crystals.

The old Moebius process, in use at Pittsburgh, Pa., and Perth Amboy, N. J., and in which a fixed cathode is employed, is distinguished from the Moebius continuous band process, now used at the Globe smelter of Denver, Colo., and characterized by a moving silver cathode band. A few years ago Gustave Nebel, formerly an assistant to Dr. Moebius, discovered that oil will prevent the close adherence of the electrolytically deposited silver crystals to the belt, which fact has been successfully applied by Mr. Nebel to the band process as employed in the new Globe refinery.

Another important improvement made in the last-mentioned plant was the replacement of the platinum electric contact points, formerly employed, by the both cheaper and better conducting contact points of silver and the recognition of the necessity of removing the silver belts from the electrolyte when not in use to avoid their gradual solution.

The cost of parting dore silver by the Moebius electrolytic process, with careful management, should not exceed 20 to 30 cents per 100 ounces.

Regarding the electrolytic refining of gold bullion, experiments were made at the Philadelphia Mint, during the past year, with the Wohlwill process, in use since 1880 or thereabouts at the Norddeutsche Affinerie at Hamburg, Germany, leading to the adoption of this process by the United States Government. The Wohlwill method of producing chemically pure gold by electrolysis, and slightly modified by Dr. D. K. Tuttle and H. J. Schlaeker, will be installed at the new Philadelphia Mint. Thus far about 2000 pounds of gold bullion have been electrolytically refined at the old Mint in Philadelphia, and, besides the pure gold, platinum and other metals of the platinum group were recovered as by-products.

The chief feature of the Emil Wohlwill process is the addition of hydrochloric acid or sodium chloride to an electrolyte of gold chloride, so as to prevent or at least diminish the evolution of chlorine at the anode and the consequent impoverishment of the gold contents of the solution electrolyzed. In this respect there is an essential departure in the behavior of gold from that of copper and silver under like conditions.

Wohlwill has demonstrated that it is practical and profitable to continuously purify impure gold and gold alloys by employing comparatively weak solutions of gold chloride and electric currents of a density as high as 100 amperes per square foot and even higher, through the combined influence of higher temperature and added hydrochloric acid.

The electrolyte used is a solution containing about 25 to 30 grammes of gold per litre, and maintained at a temperature of about 60° to 70° Centigrade, with about 20 to 50 cubic centimetres, according to the current density, of fuming hydrochloric acid with a specific gravity of 1.19, or instead 21 grammes or more of sodium chloride or common salt per litre.

When sodium chloride is employed, the amount of the compound added should in every case be limited to 100 grammes per litre of electrolyte, as otherwise the silver chloride present would be dissolved in the alkaline chloride and be deposited at the cathode with the gold, thus defeating the object in view. Therefore the amount of sodium chloride in the solution is restricted to that which will suffice to bind the chlorine evolved at the cathode.

As Dr. Wohlwill states, when the temperature of the electrolyte and the quantity of hydrochloric acid (or salt) therein are in proper accord with the density of the electric current, the anode gold, platinum, palladium and the bulk of the foreign constituents of the anode will pass into the electrolyte under the influence of the electric current. The major portion of the iridium and other metals of the platinum group remain undissolved, and with these the silver is separated as solid silver chloride. Similarly, a portion of

*Titus Ulke, in Electrical Review (condensed).

the lead is separated in the form of lead chloride as soon as the electrolyte becomes saturated therewith, or nearly so, while the bismuth is separated in the form of an oxychloride, should the amount of hydrochloric acid present be insufficient to keep it dissolved. The above-described insoluble mud, which separates and readily drops off the anode in small quantities at a time, also contains a very small amount of anode scrap and gold, forming about 10% of the weight of the anode in an extremely fine state of division. The presence of this gold is due to the fact that a portion of the anode gold is at once converted into protochloride instead of normal chloride, and the protochloride immediately after formation is decomposed into normal chloride and finely divided gold.

While, as described, a portion of the anode constituents passes over into the solution and another portion subsides in the form of an insoluble deposit, pure gold is exclusively deposited at the cathode, even from solutions of constantly increasing impurity and with currents of a density of 100 amperes per square foot. The gold extracted from the electrolyte at the cathode is therefore constantly replaced, chiefly by gold dissolved at the anode, and in part by equivalent quantities of other metals; but as the quantity of gold deposited at the cathode corresponds in part with the quantity of silver, lead and bismuth converted into solid chlorides, there is a gradual impoverishment of the electrolyte in gold, which is replaced by the addition of a sufficient quantity of gold chloride.

The simultaneous accumulation of foreign constituents in the electrolyte does not affect the purity of the gold deposited, even if there is an excess of such impurities, so long as the proper amount of gold is present in the electrolyte. In fact, the presence of these foreign constituents is even advantageous to the deposition of pure gold at the cathode, because the compactness of the deposit, which is very bulky from pure solutions (especially when currents of high density are employed), increases with an increase in the impurities in the electrolyte without affecting the purity of the deposited gold.

The above-described method of extracting gold permits of the recovery (from large quantities of anode materials) of the comparatively small percentage of platinum contained therein, which after the precipitation of the gold may be directly recovered in the form of ammonio-platinic chloride.

Mining and Metallurgical Patents.

Patents Issued January 29, 1901.

Written for the MINING AND SCIENTIFIC PRESS.

ORE WASHING AND CONCENTRATING MACHINE.—No. 666,796; C. Brash, Victoria, B. C.

An ore washing and concentrating machine, suspended receptacle for receiving water and ore, provided with outlet extending below bottom of receptacle, combined with suitable eccentrics, rod operated thereby, ring upon end of rod encircling outlet extending below bottom of receptacle, suitable curved springs placed inside of ring, means for operating eccentric.

CRUSHING ROLL.—No. 666,892; P. Argall, Denver, Colo.

U-shaped frame mounted on main frame, horizontally movable thereon, pair of roll shafts and rolls revolvably mounted in suitable bearings, one on main frame, other on movable U-shaped frame, driving pulleys fixed on both ends of each roll shaft, outside bearings, thrust collars splined on shafts between bearings and pulleys, rotating with main shafts but

longitudinally adjustable thereon, screw bolts passing through fixed pulleys abutting against thrust collars, whereby latter are adjusted, springs for drawing movable roll toward fixed roll, means for simultaneously driving pulleys and rolls in opposite directions.

CONVEYER.—No. 666,865; E. Helfensteller, Jr., St. Louis, Mo.

In conveyer, combination with driven shafts, of oppositely placed cams arranged thereon, cam blocks riding upon each cam, conveyer bars extending from one cam block to next, having one member engage cam to prevent lateral displacement of parts, loose connections between cam block and conveyer bars to accommodate expansion and contraction of parts.

FLUE DUST CONDENSER.—No. 666,978; P. Bruschi, Argentine, Kansas.

Apparatus for condensing flue dust, cooling device having narrow chambers for passage of fumes, spaced apart to form circulating air spaces between them, mixing device connected therewith into which pass fumes from cooling device for equalizing temperature of fumes, suction fan connected with mixing device, cooling precipitating cylinders, each connected with discharge pipe leading from fan, each having circular water-jacketed channel into which opens discharge pipe from fan, water-jacketed discharge pipe into which opens channel for carrying off exhaust gases, valved discharge hoppers for receiving solid matter from channel and discharge pipe.

APPARATUS FOR BURNING PULVERIZED FUEL.—No. 666,862; G. S. Emerick, Philadelphia, Pa.

Apparatus for combustion of pulverized fuel, of grinding mill for reducing fuel to powdered form, aspirating centrifugal separator for separating finer from coarser particles of powdered mass, discharge

pipe for delivering lighter separated particles into furnace, feed regulator disposed between separator and discharge pipe, means for generating air blast in discharge pipe, aspirating centrifugal separator located above feed regulator, slight lift of fine particles necessary to effect separation, particles passing by gravity to feed regulator, thence to discharge pipe.

DRILL.—No. 666,818; J. H. Redfield, Bossburg, Wash.

Drilling machine, combination drill frame, reciprocatory rod therein, shaft for operating rod having clutch member, sleeve rotatably mounted on shaft, means for holding it from longitudinal movement thereon, second clutch member mounted on shaft, means for holding it normally and yieldably against first clutch member, second sleeve inclosing first sleeve at outer end having lug, split sleeve encircling first two sleeves, split sleeve having flange engaging peripheral groove in hub of second clutch member having cam for engagement with lug of second sleeve to move split sleeve and therewith second clutch member outwardly from operative engagement, means for operating split sleeve to operatively engage lug and cam, bearing sustained by second sleeve, shaft in bearing having bevel gear on second clutch member engaging first gear.

PROTECTOR AND SHAKER FOR RECHARGING CRUCIBLES.—No. 667,131; J. Illingworth, Newark, N. J.

Improved pot shaking device, comprising engine cylinder shaking jaws, hinged together, reciprocating piston at one end working in cylinder, at opposite end having jaws loosely coupled thereto, coupling means connecting piston and jaws.

Pebbles at Considerable Depth.

TO THE EDITOR:—In your Oct. 13th issue I noticed an extract from the Georgetown, Colo., Courier on "Boulders in Mines," in which the maximum depth at which they have been found is stated to be 500 feet.

In this mine I have found small water-worn pebbles at a depth of 1150 feet from the surface.

C. H. MACNUTT.

Pulacayo, Bolivia, S. A., Dec. 7, 1900.

At Constable Hook, N. J., the U. S. Government is building the tallest chimney in America. An excavation of 20 feet deep and 45 feet square has been made to hard gravel, filled with piles closely driven and upon the platform a base of fireproof brick 30 feet square by 30 feet in height built; on the base a round chimney of brick is to be built up to a total height of 360 feet. The stack is to be 10 feet in diameter at the top and will weigh 20,000 tons. The cost will be about \$50,000.

THE New South Wales Government offers £500 to the first exploiter who produces 50,000 pounds of the metal mercury from cinnabar in that colony; the offer to hold good till 1906. The New Zealand Government has offered a premium of 4d. per pound on the first 100,000 pounds of mercury produced, a third of which quantity must be manufactured previous to March 31, 1903, the remainder before March 31, 1904.

THE Pupin invention does not do away with the necessity for the use of copper for telephone wire, but may increase the demand for copper. It will reduce the cost of equipment of telephone plants, but this very reduction will lead to more extensive installation of telephone plants. The report that Pupin's apparatus will make it possible to use steel or iron wire instead of copper is unfounded.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ARIZONA.

COCHISE COUNTY.

The Copper Queen Co., at Bisbee, has about 1600 men employed.—At Pearce, the new stamp mill of the Commonwealth M. Co. is running.

A 60-ton smelter is to be built at the Gleason mines, in the Turquoise district.

GRAHAM COUNTY.

The drift on the Veiled Prophet, near Clifton, now in 70 feet, will be continued to the 100-foot mark, at which point crosscuts will be run.—The General Electric Co. will probably buy properties near Clifton and put up a plant.

MOHAVE COUNTY.

Work on the Queen Bee, at Mineral Park, is resumed.—The Hass turquoise mines, at Mineral Park, are shipping turquoise to New York.

The Katie, at Mineral Park, is shipping ore.—The Tub, in Union Basin, Wallapai district, is bonded to Denver and Boston parties; a hoisting plant will go in and work will be pushed.—The Moonbeam, on Stockton hill, near Kingman, is leased to Rober & Wilson.—The Prince George and other mines on Stockton hill, near Kingman, will pass into the hands of an Eastern company; machinery will be put in and a shaft sunk below the old workings; main shaft is down 170 feet; a gas-line or oil-burning hoisting plant will be put in immediately.—A second payment on purchase price of the Billy Bryan, Gold Road and Gold Line, in Secret Pass district, near Kingman, was made recently; machinery will go in.

MARICOPA COUNTY.

On the Congress, northwest of Phoenix, two ledges of ore have been followed to a depth of 2600 feet; ore is said to run \$20 to the ton.

PINAL COUNTY.

On the Half Moon, 12 miles east of Florence, water is struck at 72 feet; a crosscut at this depth showed vein to be 8 feet wide.

A receiver and manager is to be appointed for the Ray Copper mines at Florence. The company was organized in 1897; in April, 1900, were issued debentures to the amount of \$486,650; the interest thereon was paid up to June 13, 1900. The appointment is at the instance of the debenture holders.

SANTA CRUZ COUNTY.

Negotiations are under way for the sale of the Red Rock, at Patagonia, for \$50,000.—The new matting plant at the Pride of the West, at Washington Camp, Supt. Gee, is running steadily.

YAVAPAI COUNTY.

Over 1000 tons of ore are reduced daily at the United Verde, Jerome.

At Jerome, the King Dev. Co. has unwatered the 1888; two shifts are drifting east and west.—The Columbia Co. is drifting for the main ledge, which is expected to be cut at the 300-foot mark.—In Big Bug district, a blower will go in on the Cliff group.—Work on the Brookshire, Big Bug district, is resumed.

Work on the Leland group, in Chaparral district, near Prescott, will resume shortly.—At the Red Rock, at Big Bug, fifteen men are working.—The tunnel in the Little Kid, on Slate creek, near Prescott, is in 240 feet; Supt. A. J. Pickrell.—Work is progressing at the Treasure Vault, near Jerome; M. Lawler, Supt.; shaft is down 117 feet; drift south is run 80 feet.—The Mingsus M. Co. has put in a 40-ton hoist on the Mingsus mountain property, 12 miles from Jerome.—Work on the Silver King, on Groom creek, near Prescott, will resume on the 15th inst.

Boring machinery is going in on property between Prescott and Jerome—drilling for oil.

YUMA COUNTY.

Work is in progress on the Desert Dwarf (gold), 6 miles from Weldon; shaft is down 40 feet; vein at that depth shows 22 inches of hematite ore, running about \$37 gold to the ton.

CALIFORNIA.

AMADOR COUNTY.

The case of the Keystone Con. M. Co. vs. the South Spring Hill M. Co. for alleged trespass of ground, which has been pending in the courts for several years, has been decided by the Superior Judge of Calaveras county in favor of the South Spring Hill Co.

Near Amador City the shaft on the Fremont, of the Fremont Con. group, is down 450 feet; a 25-foot ledge is opened up by a 120-foot crosscut; old shaft is being unwatered by a pump said to be the largest in use on the Mother Lode; it has a

22-inch cylinder, with 33-inch stroke; new 60-stamp mill will probably be completed by June; new men will be put on soon.—The Amador Improvement Co. expects to start up its plant at the Newton Copper mines soon, and it will probably employ eighty men; coke used in smelting ores at the mines comes principally from Australia, England and Georgia.

BUTTE COUNTY.

The Hesperian Crude Oil Co. is putting in its rig at Richardson's springs, and will begin boring for oil.

CALAVERAS COUNTY.

The Calaveras Ditch Co. of 11 and 13 William street, New York City, is incorporated under the laws of New Jersey; capital stock \$2,000,000; 200,000 shares. The company proposes to take water from the Stanislaus river and sell it to the placer mines, first utilizing it in producing electric power for the quartz mines. "After the water has been delivered to the mines it will again be collected and used for irrigating," so the prospectus says, but they will have a happy time of it.

Near Murphys, the Sugar Pine mine, on San Domingo creek, will be worked by the bonders; Jos. McClay, manager. A mill is to be put up.

COLUSA COUNTY.

The well at Wilber springs, near Arbuckle, is reported to be daily producing 1500 gallons oil.

EL DORADO COUNTY.

The mill on the Hart Consolidated, south of Georgetown, is running.—A Huntington mill will go in at the Alpine.—A mill will probably go in on the California Jack, south of the Alpine.—An 8-foot ledge is reported at a depth of 100 feet in the old Burnham, ore assaying \$50 to the ton.—Operations on the Gentle Annie, north of Placerville, are resumed; a three-compartment shaft is being sunk.—At the Shaw, near El Dorado, twenty-five men are employed; a new hoist is in and a 5-stamp mill will be in shortly; W. I. Smart Supt.—Rich ore is being taken out at the Mt. Pleasant, near Grizzly Flats.

KERN COUNTY.

W. H. Hart and others of San Francisco have acquired the whole of section 36, 28-28, near Bakersfield; two rigs will be put in and boring begun immediately.—The Minnehaha Oil Co. is preparing to sink six wells on its property, on 19, 28-28.—The Del Rey Oil Co., on 5, 29-28, has three strings of tools going.—The Acacia Oil Co., on 10, 29-28, is reported to have struck oil sand.—The Kern River Mutual Oil Co. will begin drilling on 4, 29-28, soon.—The Pittsburg Oil Co., operating in Sunset district, has recovered its tools and will probably go ahead with its work.—The Emperor Oil Co., newly incorporated, is drilling on 2, 11-24, near Sunset.—McIntosh & Gilfillan will organize companies to operate in the Temblor field.—C. A. Canfield will begin drilling for oil in the Midway district soon.—The Pacific Con. Oil Co. has struck a stratum of oil sand near Midway, 50 feet thick.—The Bay City Oil Co. has struck oil.—The Sunset Diamond Oil Co., on 13, 11-24, near Sunset, has its well down 750 feet; it is producing a good grade of oil; a new rig will be put in.

The Sunset Queen Oil Co. has begun drilling on 31, 32-24, near Sunset.—The well of the Chicago Crude Oil Co. is down 1250 feet.—The Sunset O. K. Oil Co. is putting in a rig.—No. 4 well of the Junction Oil Co., Bakersfield, is down 890 feet and is producing 520 barrels per day.

The Ha Oil Co., capital \$500,000, is organized at McKittrick to work 320 acres of land near there.—The Maricopa Oil Co., capital \$300,000, is incorporated at Bakersfield.—The Chicago Crude Oil Co. is building a 25,000-barrel concrete reservoir on the northwest corner of quarter 30, Bakersfield, and the Toltec Oil Co. will build one of the same capacity on the southeast quarter of 30, 28-28.—The Diamond Jubilee Oil Co., capital \$250,000, is incorporated at Bakersfield.—Globe No. 4 well is now producing 125 barrels of oil per day.—The Virginia Oil Co. is putting in a second standard rig.—The McWhorter Refining Co.'s plant at Kern City is now running, turning out asphaltum and distillates.

The new 100-stamp mill going in on the Yellow Aster, at Randsburg, is expected to be crushing ore by the middle of March; it is estimated they will require only 1500 gallons of water daily, against 9000 gallons now used.

LOS ANGELES COUNTY.

The well of the Pacific King Oil Co., in the Newhall field, is down 1325 feet; boring is in progress.—The Whittier Grande Oil Co., operating in the Whittier field, is down 1000 feet.—The Pacific Slope Oil Co.'s well No. 5, Los Angeles, recently completed, is turning out about twenty-five barrels oil per day; No. 6 is down over 270 feet.—It is reported that the Santa

Fe R. R. Co. has contracted for 750,000 barrels oil per year; the company is now using 30,000 barrels oil per month for fuel.—The Nueva Camulos Oil Co., operating on Western avenue, north of the Weid tract, Los Angeles, has completed one well which is producing twenty barrels oil per day; another well is being drilled.—Freeman & Nelson have struck another vein of white oil in their No. 3 well, at Placerita.—The Pioneer White Oil Co. is drilling at 900 feet.—The well of the Lola Co. is down 1100 feet.—The Whittier Producers' Oil Co. is drilling a well near Puente; well is down 200 feet.—The well of the Western Star Oil & Coal Co., now down 750 feet, is expected to strike oil at a depth of 1100 feet.—No. 1 well of the Reliance Oil Co., at Ivanhoe, is down 800 feet; oil sand is expected at 1200 feet.

MARIPOSA COUNTY.

The shaft of the Merced at Coulterville is down over 900 feet. There is about 300 feet more to go.

NEVADA COUNTY.

The old hoisting plant at the Reward is being removed to the Mistletoe, near Rough and Ready; Supt. C. Graham.—At Grass Valley a new 5-stamp mill will go in on the Golden Gate; G. R. Tuttle, Supt.—The pump at the Diamond is running steadily; Supt. G. Murphy.

PLACER COUNTY.

The Azalea tunnel, at Blue Canyon, is in 2814 feet; an upraise is being run; Supt. T. Rodger.—At Dutch Flat the Rawhide Quartz M. Co., capital \$50,000, is incorporated.

SANTA CLARA COUNTY.

Indications of a quicksilver mine have been found by the Silver Creek M. Co. 3 miles east of Evergreen. Cinnabar float has been found.

SHASTA COUNTY.

Herron & Leach have resumed operations on their property north of Mt. Shasta.—An exploration tunnel will be run on the Sally Ann group at Lower Springs.—Wise Brothers are shipping ore from their claim, near Lower Springs.—At Deadwood the Brown Bear mill is shut down, and a number of men are laid off; drifting in mine is in progress.—Owing to snow and bad state of the weather, the Luppin and Zent mines are shut down.

The Washington, Three Sisters and other adjoining properties, near French Gulch, will probably be consolidated and worked under one management. Work will begin about April 1.

SIERRA COUNTY.

The Rising Sun, at the mouth of Slug canyon, near Downville, is sold to J. W. Finney, who recently bought the Telegraph, at Fur Cap, and who has men repairing the old tunnel; when repairs are completed, two shifts will be put on and tunnel will be extended.

SISKIYOU COUNTY.

S. Seliski, operating near Graham gulch, on South Fork of the Salmon river, from a pocket of ore recently obtained \$7000.—Clute & Cleland will soon begin operations on Humbug creek.

Work is under way at the Fernandez hydraulic mine, on Cherry creek, near Yreka.—At the Cherry Hill (quartz), on same creek, considerable ore is on hand waiting for the mill to start up.—It is said that all ore shipped from the Dewey, 6 miles west of Gazelle, averaged \$35 to the ton; work on the 10-stamp mill has been delayed recently by stormy weather.—The Gold Run, on Knownothing creek, near Yreka, is running steadily; A. Dannenbrink, Supt. A 10-stamp mill is on the property.—Work will soon be started on the Oro Fino and Mugginsville hydraulic claim.

TULARE COUNTY.

The La Mesa Chiquita Oil Co., capital \$200,000, is incorporated at Porterville to work oil lands in township 25, range 28, north of the Kern river oil district.

TUOLUMNE COUNTY.

J. Hamilton is working his property between the Providence and Starr King mines, near Carters.—Ten additional stamps are going in in the mill of the Black Oak; good ore is being mined.—Sinking is in progress at the Poison Oak, near Soulsbyville.—Thomas & Phillips will sink a shaft near the Poison Oak.—At the Jeremiah, near the confluence of the North Fork and main Tuolumne river, near Carters, work is being pushed in the lower tunnel; the vein is 4 feet wide.—The main working shaft at the Seminole, now idle, is down 336 feet at an angle of 45°; it is 5x8 feet in the clear, 12x12 timbers. A drain tunnel is run 85 feet below the bottom of the shaft.

COLORADO.

CHAFFEE COUNTY.

The Stockton tunnel at Cleora is sold to Michigan men. One hundred feet of tun-

nel is run and an additional 100 feet will be driven.

CLEAR CREEK COUNTY.

The shaft on the P. T. of the Stanley Con. is down 266 feet; 600 feet of laterals are run. A new plant is to go in. An additional 400 feet will be sunk.—The following table will show the stamp and concentrating mills in operation at Idaho Springs, with daily capacities of each:

Mill.	Kind.	Tons.
Newton....	Concentrating	80
Roberts....	"	80
Smith.....	"	50
Donaldson..	"	80
Stanley....	"	50
Allan.....	"	80
Mixell.....	Stamp	30
Anderson..	"	20
Wilkie....	"	30

Total.....500

Connors & Co. are driving a level on the Mineral Chief, Idaho Springs.—Half the stations on the Red Oak tramway are completed.—Work is begun on the Buckeye State, on Democratic mountain. The lower level will be driven ahead.—The Kaverne M. & M. Co., capital \$500,000, and the Alpha G. & S. M. Co., capital \$50,000, are incorporated at Idaho Springs.—Two tunnels, 200 feet apart, are run on the Maud S., near Empire.—The shaft on the Gold Fissure is down 165 feet. Stations are cut and levels started in both directions. Two shifts are working.

EL PASO COUNTY.

A one-fourth interest in the C. H. M., Woodland Park district, is sold to F. Bronk for \$2500.

The Galena & Beacon Con. G. M. Co., capital \$1,500,000, is incorporated at Colorado Springs.

FREMONT COUNTY.

The pyritic smelter at Florence is running smoothly.

GILPIN COUNTY.

A new Cornish pump is to go in on the Gregory-Buell (consolidated) at Central City.—The shaft on the East Whiting, Central City, is down 440 feet. The mine is connected with the Gilpin County Tramway Co.'s line, over which the ore is carried to Black Hawk stamp mills and sampling works.—R. C. Miller of Chicago, Ill., operating the Gundy, in Chase gulch, near Central City, has men sinking a shaft, now down 105 feet, to the 165-foot level.—A strike of copper ore is made on the 150-foot east level of the Powers, in Willis gulch, near Russell.

Ore netting \$40 to the ton is being taken from the 300-foot level of the Washington Extension, in Lake district.—The Justice, in same district, is being operated by the New Haven & Denver M. Co.; twenty men are working; Manager F. Goldsmith.—Moody & Co., leasing the Baldwin, in lower Russell district, are taking out good ore at a depth of 50 feet.—The Maume Tun. & Leas. Co. are running a tunnel from Russell gulch to Willis gulch; it is now in 700 feet.—The shaft on the British, in Illinois-Central district, near Central City, is down 220 feet; Manager H. M. Cowell; a good streak of lead ore is opened up in the 200-foot level.—During January 288 cars, or 5328 tons, of smelting and crude ore were shipped from Black Hawk.—A new 24x45-foot shaft house is completed on the Bonnie Belle, on Colorado hill, near Pine Creek.

GUNNISON COUNTY.

The coal mines of the county are running; the Alpine and Black Diamond, at Baldwin, are producing 400 tons coal daily; the Colorado Fuel & Iron Co., at Crested Butte, is shipping nearly 100 carloads of hard and soft coal and coke daily. H. B. Gillespie of Denver has organized a party of twenty prospectors to explore and prospect near Taylor park, at the head of Taylor river.

HINSDALE COUNTY.

The tunnel on the Golden Fleece, near Lake City, is in 2000 feet.—New hoisting machinery is going in on the Hiawasse.—At the General Sherman a new hoist is going in.

JEFFERSON COUNTY.

Work on the buildings for the new pyritic smelter of the Clear Creek Ore Reduction Co. at Golden is begun. The furnace will have a daily capacity of 100 tons of ore.

LAKE COUNTY.

Sinking pumps are in on the Bon Air, Leadville, and the sinking of another 100 feet is in progress.—The shaft on the Nisi Prius, Leadville, is down 700 feet; Manager S. J. Sullivan.

LAS ANIMAS COUNTY.

The output of coal of the mines of the county for 1900 was 2,205,814 tons.—The Colorado & Southern Railroad Co. is building a branch road from Trinidad up the Las Animas river to the Stonewall region. It will tap

large coal and stone deposits which the Colorado Fuel & Iron Co. and Boston men are preparing to open up.—The population of the county, as given by the last census, is 21,842, of which 5345 are credited to Trinidad.

OURAY COUNTY.

Ore running from 400 to 1000 ounces to the ton is reported opened in the old crosscut in the Governor, near Ouray. At the Camp Bird Extension, near Ouray, the adit level has opened up ore, at a depth of 40 feet, running from \$30 to \$35 to the ton.

SAGUACHE COUNTY.

The new railroad between Moffat and Crestone is expected to be completed by May 1.

SAN JUAN COUNTY.

The Notaway G. & C. M. Co., operating on Sultan mountain, near Silverton, will work electric drills, power being generated by a 5 H. P. gasoline engine.—The Almira M. Co. will run an 8x8-foot crosscut tunnel to tap the Silver Ledge at great depth. A new 100-ton concentrator is also contemplated.—Work on the Daniel Webster, in Prospect basin, near Silverton, is progressing favorably. Nine men are employed.—A 90 H. P., 16-drill air compressor will go in near the Natalie to develop it and the Occidental.—The Emma tunnel, on Galena mountain, is going in at a good rate. After May 1 it is probable that electric or air drills will be used.—Dennison, Eben and others of Denver, owning the Pride of the West, will probably put in a plant on the property soon, and push work on an extensive scale.

SAN MIGUEL COUNTY.

The following table shows mineral output of mines of the county for the year 1900:

Mine—	Gold.	Silver.	Lead.
Smug'r-Union.	\$533,000	\$267,000	
Tom Boy.....	527,400	18,600	40,000
Liberty Bell....	200,000	100,000	
Ophir Tunnel.	75,000	37,500	37,500
Japan.....	58,450	25,000	36,000
Gold King.....	125,000		
Butterfly.....	70,000	7,000	
Carribeau.....	60,000	20,000	
Alta.....	10,000	50,000	25,000
Palmyra.....	10,000	10,000	10,000
Key's Placer.	25,000		
Suffolk.....	30,000		
Bessie.....	25,000		
Miscellaneous.	20,000	30,000	

Total....\$1,766,850 \$565,100 \$148,500

Copper.....\$15,000

During 1900, 461 cars of ore were shipped from the mines of Ophir district. Regarding Ophir mines, there are thirteen levels run in the Carribeau group, running from 800 to 1500 feet in length. Twenty-five men are employed in mines and mill.—On the Montezuma a 500-foot drift east and a 400-foot drift west are being run.—On the Little Eva a 500-foot crosscut and a 180-foot drift are run.—A 180-foot tunnel is run on the Merrimac, opening up an 18-inch vein.—Operations on the Carbonero are going ahead satisfactorily; two tunnels are run, the upper one being 200 feet long and the other 150 feet long; a shipment of ore was recently made to the smelter at Durango.—The tunnel on the Deadwood-Nevada is now in about 1200 feet; an electric drill will soon be in place. It is said that, upon completion of the tunnel, a mill will be put in; G. R. Dolf, manager.—During 1900 the Suffolk mill treated 1907 tons of ore from the Suffolk and 111 tons of custom ore.—On the Shoemaker a 150-foot crosscut and a 500-foot drift are run; ore treated at the Suffolk mill averaged \$20 to the ton.—A 220-foot tunnel is driven on the Sink-to-Rise; owners, Dinan & Prim.—Brink & Merrill, operating the Gertrude, Ophir, contemplate putting in a 30-stamp mill in the spring.—A 420-foot crosscut is run on the Staatsburg.—A vein of ore running from 2 to 4 feet in width is opened up in the 1500-foot tunnel of the American-Frenchman, on the north slope of Yellow mountain, near Ophir.—A 150-foot crosscut is driven on the North Star.—The tunnel on the Parsons, bonded to Bradley, Bell and others, is about 600 feet long.

TELLER COUNTY.

A strike is reported on the 263-foot level of the Red Umbrella, on Raven hill, at Cripple Creek, at a point 80 feet from the shaft.—On the Climax crosscutting is under way on the 300-foot level. The tunnel is in about 700 feet.—The Maud Helena, on Bull cliff, is shipping ore. Wood is now used as fuel, the coal supply having given out owing to the strike.—The double-compartment shaft on the Last Dollar, on Bull hill, is down 1050 feet and a station is cut at that level. Sinking will be continued.—Lessee Wrockloff, operating the Burns, is drifting on the 625-foot level. A room is being cut in the third level for a windlass to operate in the winze now being sunk from that level.

—The shaft on the Zoe is down 330 feet.—The steam hoisting plant on the Minna S. is replaced with a gasoline hoist. Good ore is being mined on the 300-foot level. The shaft will go to the 350-foot level.—Higher-grade ore is being taken out from the 700-foot level of the Golden Cycle. The company contemplates shipping 100 tons of ore daily.—The El Paso vein is opened up in a crosscut on the 350-foot level of the Cripple Creek-Columbia.—Higher grade ore is opened up by a drift on the 600-foot level of the Santa Rita.—Seventy-five tons of ore are being shipped from the 500-foot level of the Mary McKinney. Pumps are raising 900 gallons of water per minute from the 500-foot level.—The Challenge G. M. Co., capital \$150,000, is being organized at Cripple Creek.—The Bostwick G. M. Co., capital \$150,000, is incorporated at Cripple Creek.

The capacity of the Economic mill at Cripple Creek will be increased to handle 1000 tons of ore per month.—On the Little Fauntleroy, on Gold hill, Cripple Creek, a new shaft will be sunk.

The Lucky Guss, Victor, will be worked through the John A. Logan.—A new hoist is going in on the Dillon, and sinking will begin.—Sinking and drifting are in progress at the John A. Logan; a drift is being run to connect with the Orpha May.—At the Orphan Belle, on Bull hill, near Altman, an engine and shaft house are going in on the new shaft; machinery from the old shaft will go in. The plant consists of 10x14 hoist, a two-drill compressor and two 70 H. P. boilers.—Sinking is under way on the Hallie E., at Cripple Creek; a station is cut at the 50-foot level. A 15 H. P. electric hoist will go in as soon as the Colorado Electric Power Co. completes its lines to Galena hill; J. H. White, lessee.—A crosscut is being run on the .950-foot level of the Independence Con.—The King lease, on the south end of the Last Dollar, shipped 225 tons of 5½-ounce ore during January.—The Winners Leasing Co., operating the Monument, on Battle mountain, have completed development on the 200 and 300 foot levels; three machine drills are working.—Ore is opened up at a depth of 60 feet in the Mary Ann, on Raven hill; the vein is 3 feet wide, and assays are said to run from \$15 to \$90 gold to the ton.—The Bonzai Co. has patents for the Silver Spring, Grubstake, Spotted Calf and Old Ironsides, on Squaw mountain, consisting of 17½ acres.—On the Zoe the shaft is down 320 feet, and the vein at that depth is 9 feet wide.

The shaft on the Lillie, Cripple Creek, is down 1300 feet; water from the mine will be lifted by the Victor pumps; sixty tons ore per week are produced, mainly from 800-foot level.—A strike is reported at the Rag, ore running \$40 to the ton.—From 12 to 15 feet per day are being made in the Ophelia tunnel.—Ore recently struck on the 525-foot level of the Pointer is said to be running \$100 to the ton.

GEORGIA.

HALL COUNTY.

River and bank dredging is being successfully carried on near Gainesville. The four dredgers are all of the dipper type. The one now being run by E. McDowell is stated to have produced about \$120,000 in three years, on expenses of about \$12,000.

IDAHO.

BOISE COUNTY.

On the Middleman, at Pearl, sinking is in progress; twelve men are employed.

SHOSHONE COUNTY.

The Hunter Creek M. Co., Ltd., capital \$1,000,000, is incorporated at Wallace to work the Belmont and Union claims, near Mullan. A tunnel will be run on the Belmont.

It is reported that the Buffalo Hump M. Co. has sold the Tiger-Poorman, on Canyon creek, near Burke, to the Idaho-State M. & C. Co. for \$1,000,000.

MONTANA.

BEAVERHEAD COUNTY.

In Grasshopper creek, near Bannack, the Montana Gold Dredging Co., headquarters at Monmouth, N. J., states its capital stock is \$100,000—\$63,000 issued and paid in cash; assets, \$121,140; liabilities, mortgage bonds, \$30,000; bills payable, \$14,371.65; unpaid accounts, \$13,768.40. The company has not operated its boat this season, as it was closed down under attachment proceedings at the close of the season of 1900. Work has not been resumed.

B. F. White has been appointed local agent for the Montana Copper & Gold M. Co., a new corporation, to develop the Manser copper mines on Stone creek, 12 miles east of Dillon. The company is organized under the laws of Wyoming, capital stock \$1,000,000.

J. J. Cuseck states that work on the Polaris, 40 miles from Dillon, will be

pushed in the spring, and that new machinery will go in.

CASCADE COUNTY.

On account of trouble with its water power at Great Falls, the Boston & Montana Co. will put in auxiliary steam power—two plants—one 1500 H. P., another 1000 H. P. The power recently fell off so much that the refinery was closed down for a while and only 1000 tons of ore was smelted daily; the usual amount handled is 3000 tons; Manager Klepetko.

DAWSON COUNTY.

A rich pay chute is opened up on the Uncle Sam, on Elk creek, near Wibaux.

DEER LODGE COUNTY.

General Supt. Brunton is introducing in the Anaconda mines the cave system of stoping ore, designed to economize the use of timber.

SILVER BOW COUNTY.

Two sales of portions of the Minnie Healy, at Butte, are reported made to the Boston & Montana M. Co., one being for \$132,250 and the other \$8725 for a one-twentieth interest.

The Governor has signed the eight-hour law for miners and smelters. It goes into effect May 1, 1901.

NEVADA.

ELKO COUNTY.

Work on the Young America, at Tuscarora, will resume soon; a winze will be sunk from the 125-foot level.

ESMERALDA COUNTY.

Fish & Wichman have leased the Wheeler, at Pine Grove.

EUREKA COUNTY.

Returns from a car of ore recently shipped from the Rocco-Homestake, at Eureka, to Denver, Colo., show ninety-five ounces silver and 30% lead to the ton.

LINCOLN COUNTY.

At the Abe Lincoln group, near Pioche, a stamp mill and concentrator are going in; plant will cost \$25,000.

Manager Healey of the April Fool, at De Lamar, says that the mill, which includes a cyanide plant as well as stamps, will be enlarged.

The eight-hour law, regulating miners, mill workers and all reduction plants, has passed the Assembly. The bill was introduced by Burke from De Lamar, where miners are working twelve hours.

STOREY COUNTY.

The main south drift from the Gould & Curry tunnel on 450-foot level is run 386 feet; two crosscuts are being run—No. 1 east and No. 2 west.

On the 900-foot level of the Caledonia, Virginia, No. 2 crosscut is in 48 feet; on the 1000-foot level the northwest drift from the north drift is in 117 feet.—Ten cars of ore recently shipped from the 900-foot level of the Overman returned \$22.51 per ton, \$13.76 being gold.—The Bowie claims at Virginia are reported sold for \$3000.

During week ending Feb. 2d, four cars of ore, or 255,050 pounds (railroad weight), running about \$7216 to the ton, were shipped from the Consolidated California & Virginia, at Virginia, to the Selby Smelting & Lead Works, San Francisco.

The west drift in the Burning Moscow is retimbered; west drift on 56-foot level of Central tunnel of the Ophir is run 295 feet.—No. 2 crosscut on Central tunnel level of the Mexican is in 291 feet.—The Hale & Norcross tunnel is now in 2003 feet.

At the Sierra Nevada, the west drift on the 1600-foot level is cleaned out and repaired for a distance of 960 feet from shaft.—At the Potosi, the north drift on the 80-foot level of the Greek shaft is in 242 feet.—The northwest drift in the Silver Hill is run 177 feet.—At the Gould & Curry stoping is in progress on first, second, third and fourth floors of the 325-foot level.—The west drift from crosscut No. 9 on the Best & Belcher is in 51 feet.—Surface tunnel No. 2 of the Utah is in 854 feet.

WASHOE COUNTY.

A double-compartment shaft will be sunk on the Star, near Reno.—In the suit of C. Bell vs. G. Wedekind, decision is rendered in favor of the latter.

A recent crushing at the Slip mill of forty-four tons of ore from the Gold Ledge, near Olinghouse, returned a bar of gold weighing 129.19 ounces, which netted \$1935.85; it is said that W. C. Williams, operating the Gold Ledge, has taken out \$40,000 in the last ten months, working eight men.

NEW MEXICO.

BERNALILLO COUNTY.

The new Woodbury mill at Bland is about completed.—The Star mill will probably go in this year.—Operations are under way at the Albemarle mill.—A new smelter is going in at Algodones.

COLFAX COUNTY.

The Aztec, in Cimarron district, near Elizabethtown, has produced over \$1,-

000,000 in gold.—A Chicago company is building a dredger on the Moreno placers; a ditch 42 miles long brings water from Red river to the placers.

DONA ANA COUNTY.

The New Mexico Lead Co. is building works near San Andreas.

GRANT COUNTY.

Good progress is being made on the new mill at Deming.—The Mineral Point Zinc Co. is shipping zinc ore from its properties near Fierro.

The Clifton Copper Co., capital \$500,000, is incorporated to work the mines near San Jose.—The shaft on the Gillett, at Pinos Altos, is making good progress; it will go to the 1000-foot level.—Operations on the Golden Giant and Mammoth are temporarily suspended.—High-grade ore is being prepared for shipment at the Mountain Key; W. C. Chandler, Supt.—F. J. Davidson & Co. are working the Arizona.

LINCOLN COUNTY.

The Old Abe, at White Oaks, is producing good ore from the 1000-foot level.—The Jicarillo placers have passed into the hands of the American Placer Co.; new machinery is going in.—The Bethlehem Iron Co. will put in new machinery on its coal property near Nogal.

RIO ARriba COUNTY.

St. Louis and Kansas City, Mo., men are working the Chama placers, which are estimated to hold \$10,000,000 in gold. Gold is found intimately associated with black sand, and a smelter to treat the latter will probably be put in this year.

SANTA FE COUNTY.

The Cerrillos smelter will probably resume operations this month.—At Madrid the Cochiti mines are using electric light and power.—The 350-ton smelter at San Pedro is running.—Near Golden the new Woodbury mill is completed.—The Madrid coal mines are sold to the Colorado Fuel & Iron Co., and the O'Mara coal mine is sold to the Santa Fe G. & C. Co.; both companies will put in new machinery.—The Galisteo Co. has an experimental mill, using the Edison process, in operation on the Ortiz. The new Edison plant will cover several acres of ground and will be capable of handling 32,000 tons of gravel daily.

SIERRA COUNTY.

A. Walker has bought a five-sixths interest in the Ashville, near Grafton; it is reported that he has also bought the Alaska and Montezuma mines and a claim of the McDonald group.

TAOS COUNTY.

The Copper Hill M. Co., operating copper mines at Rinconada, has its 100-ton concentrator running at that point; seventy-five men are employed in mines and mill.—The Rio Hondo Copper Co. is preparing to put in large copper reduction works at Amizett; a tramway is in, and the tunnel is run 450 feet; thirty men are employed.—At Red River the June Bug mill is completed.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Pluma M. Co. has men sinking a shaft on the Tenbrook, near Pluma; W. A. McCain, general manager.—The Gopher M. Co. of Minneapolis, Minn., has put in a new gasoline hoisting plant on the Lena, 4 miles north of Hill City; the shaft will go down several hundred feet.—The Belt Dev. Co. of Colorado Springs, Colo., will sink a 600-foot shaft; the latter will be three-compartment to a depth of 100 feet, and for the balance of 500 feet it will be two-compartment.—The National M. & S. Co. of Maine will probably put in a 500-ton smelter on the Bullion, in Bear Butte district, east of Deadwood.—The twenty-ton cyanide plant at Ragged Top, recently destroyed by fire, will be replaced by one of larger capacity.—The crosscut tunnel being run by the American M. Co. is in 500 feet.

OREGON.

BAKER COUNTY.

A 20-stamp mill is to be built on the Alamo mine, Sumpter; J. C. McGuigan, Supt.

The Golconda at Baker City is reported bonded to C. A. Smith of Pittsburg, Pa., who represents the syndicate which will probably buy the property. Mr. Smith is president and general manager and will put on men.—The final payment of \$20,000 is made on the Iron Dyke (copper), on Snake river, near Ballard's Landing.

JOSEPHINE COUNTY.

Piping is temporarily suspended at the Davis (hydraulic), in Jump-off-Joe district, near Grant's Pass, owing to cold weather.

JACKSON COUNTY.

The mill at the Ashland, near Ashland, is enlarged. Ten stamps are now dropping on ore from the Ashland.—Twenty tons of ore recently shipped from the

Columbia, near Sumpter, to the sampler at Baker City gave returns of \$50,000.—After sampling the ore was sent to the Everett, Wash., smelter.

LAKE COUNTY.

Near Warner lake, 125 miles south of Burns, deposits of nearly pure borax are found. A plant is in on the property; the product is hauled in wagons to Winnemucca, Nev., a distance of 125 miles, where it is shipped to market.

UTAH.

CARBON COUNTY.

The first carload of hard coal from a Utah mine was marketed in Salt Lake on the 30th ult. from the Castle Valley, 9 miles north of Price; Milner & Gilson, owners; deposit was found fifteen years ago, but development done recently; a 250-foot drift is run; buildings are up, tracks laid and shipments will be made regularly; vein is 5 feet 4 inches thick.

A carload of elaterite was recently shipped East from the mine of J. A. Curtis, at Soldier Summit, operated under bond by G. F. Tims, of Washington, D. C., and T. B. Beatty, of Salt Lake.

JUAB COUNTY.

An assessment of 1 cent per share is levied by the Martha Washington M. Co., Tintic.—The new May Day mill is expected to be in operation within thirty days.—The shaft on the Black Jack & Trail, Tintic, now down 400 feet, will go to the 1000-foot level.—Five cars of ore recently shipped from the Lower Mammoth, at Tintic, netted \$5125; three of the cars yielded ninety-two ounces silver and 10.8% copper to the ton, while the other two cars ran 92 ounces silver to the ton.

PIUTE COUNTY.

The crosscut on the 300-foot level of the Park G. M. Co.'s property, at Marysville, in 70 feet, has opened up good ore; General Manager Gibbs.

SALT LAKE COUNTY.

The tunnel on the Julia S. group, near Bingham, now in 300 feet, will be run an additional 300 feet.—Ore from a recent strike made in the tunnel of the Ben Butler assays 30% lead, 126 ounces silver and about 60 cents gold to the ton; Supt. McQueen.

The new smelter of the Bingham C. & G. M. Co., at Bingham Junction, was started on the 31st ult.—More men are put on at the Dewey tunnel, in Big Cottonwood canyon.—The cyanide plant at the Overland, Bingham, recently enlarged, has a tank capacity of 1900 tons, and is capable of handling 500 tons of ore daily.

SUMMIT COUNTY.

The Quincy, at Park City, is shipping eight wagonloads of ore to the Mackintosh sampler daily.—Another carload of machinery for the new Silver King plant is received; construction work is progressing favorably.

The deal for the sale of the West Ontario group, at Park City, is about completed.—An assessment of 2 cents per share is levied by the Creole M. Co.—The tunnel on the Wasatch is in 380 feet.—Supt. Sutton of the Constellation is drifting south on the vein.

TOOELE COUNTY.

A new plant, including a 25 H. P. boiler, a 6x8-foot engine and hoist, and a Leyner compressor and drill, tanks, etc., are going in on the Stockton, at Stockton, operated by the Stockton G. M. & M. Co.; a concentrator will probably go in this spring.—Work is started on the Pelican, near Stockton.—Drifting is under way in the main tunnel of the Honerine, at Stockton, 100 feet below the old workings.

UTAH COUNTY.

A strike of "anthracite" coal is reported in the tunnel of the Provo Anthracite Coal Co.'s property, in Rock Canyon, 8 miles northeast of Provo; tunnel is in over 1500 feet.

WASHINGTON COUNTY.

W. F. Snyder has bought a one-sixth interest in the Dixie, at Saint George, for \$5000.

WYOMING.

CARBON COUNTY.

The shaft on the Ferris-Haggerty, at Grand Encampment, is down 300 feet.—New machinery, including hoist and pumps, will go in on the Rambler (better known as the Doane); a double quadruple shaft will be sunk.—The Kurtz-Chatterton C. M. Co. is sacking and piling up concentrates for treatment at the new smelter, now being built at Grand Encampment.—The shaft on the Great Lakes is down 300 feet; 120 feet of crosscuts are run.—The Hercules shaft is down 200 feet.—The shaft on the Dewey, of the Union C. M. Co., now down 65 feet, will be sunk an additional 500 feet.

LARAMIE COUNTY.

During the year 1900 the iron mines at Hartville produced 1000 tons of ore daily; the output was used at the Pueblo, Colo.,

smelter of the Colorado Fuel & Iron Co.—It is said that the Union Pacific R. R. Co. will build an iron foundry and blast furnaces at Cheyenne and that the Burlington R. R. Co. will build iron and steel works at Guernsey.

WASHINGTON.

OKANOGAN COUNTY.

The Okanogan Free G. M. Co. of Oroville is reorganized in Minneapolis, Minn., under the name of the Golden King M. Co. On the Bonnie Lassie group, one-half mile east of Loomis, the tunnel is in 65 feet.—The Q. S. tunnel is in 560 feet.—At the Carbon, 5 miles north of Loomis, near Palmer lake, work in the tunnel is progressing.—Operations on the Ella group, near Golden, are resumed.—At the Golden Zone, one of the mills is running; the other will start up shortly; the crosscut tunnel being run, now in 300 feet, will be driven to the 1000-foot mark.—An air receiver is going in at the Puritan mines, on Gold Hill; the compressor will be placed on Toats Coulee creek near mouth of the 5000-foot tunnel, and air will be forced up to workings on top of hill, a mile and a half distant.

STEVENS COUNTY.

A new company is incorporated at Colville to work the Nevada, Big Stocks and Fresno claims, 10 miles east of Boundary.—Good progress is being made in the long crosscut of the Bear Mountain M. & D. Co., near Colville.

FOREIGN.

BRITISH COLUMBIA.

At the annual meeting of the Knob Hill M. Co. of Rossland, President Miner reported that an agreement had been reached between the directors of the Knob Hill, Ironsides, Gray Eagle and Granby Smelter companies to combine. The plan is to form a new company under the name of the Granby Consolidated Smelting & Mining Co., Ltd., with a capital of \$15,000,000, of which \$2,000,000 is to be held as treasury stock.

The benches on Pine creek, near Pine City, Atlin district, are being worked this winter; considerable gravel is being piled for sluicing in the spring.—The Nimrod Co. has its stamp mill on Monro mountain, near Atlin, running.—The Columbian M. Co. has bought a group of claims on Spruce creek, near Atlin, for \$20,000; a hydraulic plant will be put in.

The new forty-drill air compressor for the Rossland-Great Western at Rossland is expected to be on the ground by the 11th; the plant will be run by electric power. The new intercooler for the new compressor differs from those now in use, it being cylindrical. A new compressor is expected to be in place next month.—Good progress is being made in running the tunnel from the Gopher into the Homestake; the ledge was recently struck at a point 150 feet from the shaft.—During December the eighty stamps at the Ymir mines, at Ymir, ran 611 hours (25 days 11 hours); the estimated profit was \$23,600.—The main tunnel in the Queen Bess is in 1665 feet.—Five feet of copper-gold ore is struck by the diamond drill on the 300-foot level on Green mountain.

The new air compressor for the Rossland Great Western, at Rossland, has compound or two-stage air cylinders 36 inches and 22 inches in diameter, with 42-inch stroke; compressor will be driven by an electric motor through the medium of a rope drive; drive wheel is 18 feet in diameter, with 51-inch face, grooved for twenty-two ropes 1½ inches in diameter; wheel is made in halves, has a double set of arms and weighs 40,000 pounds; low-pressure air cylinder has Corliss air valves driven by special valve gear; intercooler is of most recent water tube type; machine complete weighs 150,000 pounds.

At Rossland a strike is made at the Green Mountain on the 300-foot level; ledge is 5 feet wide.

The Galore, Emma Fraction, Santa Rosa, Hidden Hand, Last Edition, Myrtle Fraction, Jew Fraction, Mac and Violet claims, near Fort Steele, are reported bonded to the Fort Steele Development Syndicate for \$45,000.

NOVA SCOTIA.

The gold output for 1900 is given at 31,110 ounces. During the same period the production of iron ore was about 16,000 tons, which came from the mines of the Nova Scotia Steel Co. at Bridgeville.—At Pictou the furnace of the Copper Crown Co. is running.—The 1900 output of the Barytes, at Cape Rouge, Inverness county, was 783 tons of ore.

ONTARIO.

One thousand tons of ore from the Wendigo, Lake of the Woods district, recently put through the Keewatin reduction works at Keewatin returned an average of \$4 per ton. The cost of mining, shipping and milling was \$2.07.—Reports from the Sultana, on Shoal lake,

state that rich ore is being taken out from the new workings on the Crown Reef. The ore is said to mill an average of \$40 per ton.—The mill at the Hammond Reef, in Seine River district, is now operated by electric power, the same being generated from a plant 4 miles from the mill. Forty stamps are dropping. The cost of mining and milling the ore at the mine is said to be a little over 90 cents per ton.—The Gold Panner, Lake of the Woods district, will resume operations March 1.—The Ontario Government now furnishes diamond drills for the use of mining operators in the province.—The Bullion No. 2, near the Mikado, on Shoal lake, is reported sold to Major Motley.—The Boulder M. Co. will cut 1000 cords of wood to continue operations through the winter.—A diamond drill is in at the Mikado.—Ore from the Sultana is said to be giving \$11 in gold on the plates.

A new plant is going in at the Rock Lake, 12 miles north of Bruce mines.—The reduction works of the Ottawa G. M. & M. Co., at Keewatin, recently crushed 925 tons of ore from the Sakoos, Lake of the Woods district, returns from which were \$10,060.98.

SOUTH AFRICA.

A report from Cape Town states that the Boer attack on the Boksburg mines resulted in damages amounting to £300,000 (\$1,459,950).

TASMANIA.

During the six months ending Sept. 30, 1900, 167,221 tons of ore were smelted at the works of the Mt. Lyall M. & R. Co., yielding an average of 2.82% copper, 1.98 ounces silver and .07 ounces (about \$1.34) gold per ton.

Personal.

S. T. GODBE, of Pioche, Nev., is in Salt Lake, Utah.

F. B. COOK of Salt Lake, Utah, is in southern Idaho.

D. W. RECKHART is president Superior mine, Lordsburg, N. M.

H. MCCORMICK and L. BROWN, of Salt Lake, Utah, are in Oroville, Cal.

F. REID, manager Doric M. Co., Idaho Springs, Colo., has gone to England.

F. L. BATES succeeds R. C. Esson as master mechanic S. P. Co. at Newark, Cal.

J. B. SHAW is elected Sec'y Scorpion M. Co., Reno, Nev., vice G. R. Spinney, deceased.

WM. P. MILLER is appointed consulting engineer Republican M. Co., Jacksonville, Cal.

J. P. KERIN of Denver, Colo., is appointed State agent Triumph G. M. Co. at that point.

C. W. POPE of San Francisco, second vice-president Shasta Con. Oil Co., is in Redding, Cal.

J. SCHOENFELT, Pres. Mountain Lily M. Co., has returned to San Francisco from Columbia, Cal.

E. M. BIND, E. M., of San Francisco, is in Durango, Mexico, examining mining properties. He will return April 10.

Ex-Gov. J. E. RICKARDS of Montana, chairman board of trustees Montana School of Mines, is in Salt Lake City, Utah.

R. A. THOMAS, Pres. Black Hills Cop. Co. and of the Mingus Mountain M. Co., has returned to Los Angeles, Cal., from Prescott, Ariz.

D. L. GREGG, former manager Ingersoll-Sergeant Drill Co., at Salt Lake, Utah, has resigned. He is now assistant manager of the Mine & Smelter Supply Co. at that point.

S. W. ECCLES, late traffic manager of the Oregon Short Line, has been appointed traffic manager of the American Smelting & Refining Co. at a salary of \$20,000 per annum, with headquarters in New York. Mr. Eccles has resigned his present position, to take effect Feb. 15.

P. M. DE LEON, U. S. Consul to Guayaquil, Ecuador, S. A., is in San Francisco. He says that last December "a syndicate of English and American miners, largely interested in the Transvaal, secured all the mining rights to the entire State of Ecuador for a term of fifty years," and that "for these rights the Government will receive a heavy dividend."

Commercial Paragraphs.

THE U. S. Navy Yard, Bremerton, Washington, was recently equipped with Cross oil filters by the Burt Mfg. Co. of Akron, Ohio.

FIVE 35,000-barrel storage tanks are being erected in the Bakersfield, Cal., district for the Standard Oil Co. and others by the Lacy Mfg. Co., Los Angeles, Cal.

THE Baker Iron Works, Los Angeles, Cal., has added the manufacture of steam engines of the simple horizontal type, adapted for the drilling trade. They have put in an electric crane, steam hammers, lathes and milling machines.

HENDRIE & BOLTHOFF MFG. & SUPPLY CO., of Denver, have sold two Witte gasoline hoisting engines, of 40 H. P. each, for the Crown Point & Virginia mine at Idaho Springs, Colo. These engines supplant a large steam hoist and will be installed within a month.

THE Risdon Iron Works of San Francisco has shipped a dredging outfit to the Birrim Valley Gold Mining & Dredging Co., on the African gold coast, including a ladder dredger, thirty dredger buckets, eight stone buckets, boiler, engine, electric light engine and dynamo—in all 690 packages.

JOHN WIGMORE SONS CO. recently shipped to Bisbee, Ariz., a specially built steam hoist and a 70 H. P. boiler for the Bisbee West Copper M. Co. The iron work for a 15-stamp mill, recently shipped for the Joseph Wharton property at El Dorado Canyon, Nev., was also from the Wigmore Works.

THE Pacific Coast Mfg. Co., a corporation capitalized at \$100,000, has recently purchased the merchandise, agencies and leases of the Boothe Mfg. Co., Los Angeles, Cal. The general manager of the new concern, also its vice-president, is J. A. Haskett, for sixteen years identified with the Kansas City house of Fairbanks, Morse & Co. Valentine Peyton, former owner of the Mt. Lowe, Cal., Railway, is president and A. L. Hawes of Los Angeles is secretary.

THE Edw. P. Allis Co., through its Spokane, Wash., office, has an order from the Northport M. & S. Co. of Northport, Wash., for one Holthoff-Wetthey double-deck matte calcining furnace, each hearth being 10 feet wide and 100 feet long—the third furnace they have installed at this plant, the other two being single-deck, 10x100 feet each. The Spokane agency also has an order for two large blast furnaces, size 44x160 inches at tuyeres from the Montana Ore Purchasing Co., Butte.

A SUCCESSFUL electric rock drill has been constructed and the Gardner electric drill is demonstrating its practicability. This drill was placed upon the market almost a year ago and has passed through the experimental stage. A number of them have already been purchased and are stated to be operating successfully, offering many attractions in the economy of installation and operation. A number of them are now used on the Pacific coast. The California Electrical Works, 409 Market St., San Francisco, have recently taken up the manufacture and will carry a stock of complete drills and repair parts.

THE Vesey safety tamping plug, being introduced by W. N. W. Blayney, Denver, Colo., consists of a hardwood cylindrical piece, 6 inches long, cut diagonally into two sections, but held together by a small segment; a hole for the fuse to pass extends through it lengthwise. When the hole is loaded the cap is placed on the fuse in the usual way, and the plug is then put in the hole against the powder. A light tap struck against the small section of the plug breaks it from the larger section, driving the former like a wedge into the hole, firmly fastening the plug. It is claimed that the device saves time in loading, makes the work safer and, by reason of the tightness or firmness of the tamping, the explosive becomes more effective.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DEVICE FOR REMOVING CAPS FROM CANS AND THE LIKE.—No. 667,145. Jan. 29, 1901. J. W. Fuller, of Portland, Or. This invention relates to a device for the easy removal of screw caps from the tops of cans and other receptacles to which they are applied. These caps, when

screwed down to form a tight joint, often become set or stuck in place, and it is difficult to remove them. The invention is designed to make such removal easy. It consists of a disk which fits the interior of the screw cap, has an outwardly projecting lug, and this extends through a correspondingly shaped opening or notch, so that it extends above the top of the cap. In this lug, which is preferably oval or elongated in one direction, is a groove or channel, and this serves for the introduction of the blade of a screw driver laid in sidewise, or any bar of sufficient strength and length to give the proper leverage by which the cap may be opened.

END THRUST COUNTERBALANCE FOR CENTRIFUGAL PUMPS AND SHAFTING.—No. 666,869. Jan. 29, 1901. F. H. Jackson, San Francisco, Cal. It is well understood by those familiar with centrifugal pumps that the discharge pressure between the runner and the case is never equal to the total discharge pressure in the involute of the case, or the discharge pipe of the pump, and these variations causing an unequal pressure on the two sides of the runner tend to force it in one direction or the other. It is the object of this invention to automatically regulate these pressures, and so counterbalance the runner or impeller that it will always remain approximately central within the case, without the aid of collars or other mechanical support. The exterior case encloses a runner or impeller mounted upon a shaft and revoluble within the case. The suction inlet passage opens into the case upon one side and approximately centrally, and the discharge takes place from the periphery of the case. The runner being driven by any suitable motor at a high rate of speed, will, by the centrifugal action upon the water after the pump is primed, draw the water in through the inlet and discharge it through the outlet. In order to balance these pressures the impeller has a running joint in the inlet passage and an annular flange projecting upon the opposite side, and extending into a correspondingly shaped chamber within this flange revolves with the runner. The passage connects this chamber with a suction inlet and is controlled by a central plug extending into it from the side of the case, so that when the pressure upon the runner moves it to one side, this passage is opened and the water escapes so as to

counterbalance and return the runner to its central position.

Latest Market Reports.

SAN FRANCISCO, Feb. 7, 1901.

SILVER—Per oz., Troy: London, 28½d (standard ounce, 925 fine); New York, bar silver, 61c (1000 fine); San Francisco, 61c; Mexican dollars, 50c.

A. M. Townsend, agent Hong Kong & Shanghai Banking Corporation, thinks that the recent advance in silver was due to the demand from the Indian Government for silver to be coined into rupees, and that the still more recent decline is due to the withdrawal of that demand. The fall in the price is also caused in part by dearer money in London, which makes it cost more to carry the metal. Mr. Townsend says that silver is still going into China at about the usual rate.

Mexican dollars in Manila are valued by the military government at 50 cents in gold. At the high price of silver in London, Mexican dollars were more than 50 cents in Hong Kong and were therefore exported from Manila. The military government attempted to check this movement by imposing an export duty of 10% on the Mexican dollars. At the decline in silver Mexican dollars are worth less than 50 cents in Manila, while the official valuation is 50 cents. It is expected that importation of them will be resumed.

COPPER—New York: Lake, 1 to 3 casks, \$16.87½; carload lots, 16.50; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.35; Casting, 1 to 3 casks, 16.40; carload lots, 16.25. San Francisco: 18. Mill copper plates, 20c; bars, 22¢23c.

LEAD—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.20; Missouri lead, \$4.32½ desilverized lead; San Francisco \$5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6½, sheet 7½; bar 6c; pig, \$4.70 @5.10. London, £15 5s per ton.

The report that the settlement basis for lead in Utah had been lowered 10 cents per 100 pounds, and that this was merely a preliminary step to a general reduction of the price of lead to \$3.90 per 100 pounds, is in general denied. The American Smelting Co. has made new contracts in Utah at \$3.90 per 100 pounds, but it is understood that the general rate will remain at \$4.

SPELTER—New York, \$4.05; St. Louis, \$3.85; London, £18 5s per ton; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY—New York, Cookson's, 10c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13¢14c; 100-lb lots, 15¢18c.

IRON—Pittsburg, Bessemer pig, \$13.50; gray forge, \$13.30; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL—Bessemer billets, Pittsburg, \$21.00; open hearth billets, \$21.50; San Francisco, bar, 7c to 12c per lb.

TIN—New York, pig, \$26.50; San Francisco, ton lots, 29c; 1000 lbs., 29½c; 500 lbs., 29½c; less, 30c; bar tin, \$3.35c.

QUICKSILVER—New York, \$51.60 large lots; London, £9 2s 6d; San Francisco, local, \$47.50 per flask of 76½ lbs.; Export, \$44.

MAGNESIUM—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC—San Francisco, 5½c; slab, 5½c; bar, 7c.

BABBITT METAL—San Francisco, No. 1, 10c.

SOLDER—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 15½c.

ASSAY LITHARGE—San Francisco, 10c per lb. small lots.

BISMUTH—New York, \$3.25 50-lb. lots; San Francisco, \$2.50 to \$2.75 lb lots.

PLATINUM—San Francisco, crude, \$17 ½ oz.; New York, \$18.20 per Troy oz.

ALUMINUM—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

FERRO-MANGANESE—Pittsburg, 80%, domestic, \$62.50 large lots.

PHOSPHORUS—F. o. b. New York 50¢60c per lb.

POWDER—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2*, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 723 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES—Granite 6s, 16 oz., 40s., 1½c per set; 14 oz., 40s., 10c.

Copper Mining
Company

OF MONTANA.

Embodying all that
experience and
practical working
have demonstrated
as valuable in this
class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

IMPROVED PORTABLE HOISTING ENGINES

Sole Manufacturers of

Kendall's Patent Quartz Mills.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at Greatly Reduced Prices. Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

GATES IRON WORKS

The Copper Furnace herewith reproduced is one of two sold to the GRANBY CONSOLIDATED MINING AND SMELTING CO., LTD., BRITISH COLUMBIA. The size is 44x160 inches. These two furnaces were sold on a guaranteed capacity of 500 tons per day. Before the furnaces had been in operation a month they developed an average capacity of 600 tons per day, and the highest daily record has exceeded 735 tons. The cost of operation has steadily declined under the management of General Manager Hodges, until six-dollar copper ore is paying a handsome profit.

All of GATES IRON WORKS machinery is as good as it is represented to be, and often much better. We build every modern type of apparatus for the reduction of the precious ores by every established process. Our three great lines are these:

**Mining
Machinery,
Rock and Ore
Crushing
and
Cement
Machinery.**

FULL DETAILS OF OUR SMELTING
FURNACES GIVEN IN OUR

SAN FRANCISCO, CAL.

THE SNODGRASS COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the most successful machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the Cement or Clay, and saves the Gold although it is as fine as flour. It is only necessary to have from 4 to 6 miner's inches of water to work 150 tons or more every twenty-four hours. The machinery consists of two iron troughs or "concaves," each 26" in diameter, one of which is about 18' and the other 12' long. In these troughs are strong revolving shafts with projecting teeth, made of White Iron, 2 1/4" wide by 1 1/4" thick, placed in spiral form around the shaft about 2" apart, forming a conveyor. The first shaft is geared to make from 150 to 250 revolutions per minute, and the second one from 300 to 500. There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly. There is a space of about 4" in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is free it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made. In many cases the 18' machine alone is needed, as the two are only used where we have hard Cement or Clay to work. It requires from 10 to 12 H. P. to run the complete machine, and from 6 to 8 H. P. for the 18' one alone. I also manufacture a 6' machine about one-half the diameter of the others, and lighter in proportion, to be run by hand power, with small amount of water, and capacity of about two tons per hour. This can be easily moved from place to place.

For Testimonials and Particulars, Address : : **S. K. SNODGRASS, Denver, Colo. (The Windsor.)**

THE SIMPLEX ORE CRUSHER.

For crushing and pulverizing small quantities of ore by either hand or power. It is more easily operated than any other machine of its capacity on the market.

Its features are ease of opening for cleaning and simplicity of adjustment.

CALKINS' GYRATORY MULLER.

A recent invention for reducing crushed ore samples to a pulp. Will quickly pulverize to 100 mesh or finer.

Supersedes the slow and laborious Bucking Plate.

CALKINS' RADIAL BUCKING PLATE.

Designed to replace the old method of pulverizing crushed ore samples to a pulp of any desired fineness with but a fraction of the energy required to operate the old style Bucking Board and Muller.

THE IMPROVED BARTLETT CONCENTRATING TABLE.

The only table made that will take the place of jigs and do away with costly and complicated machinery.

Especially designed for separating zinc from lead.

Solid Iron Tops, planed to a true surface.

All parts are interchangeable.

Wearing parts reduced to a minimum.

Capacity from 15 to 45 tons in 24 hours, according to class of ore.

Our illustrated catalogue contains all the latest information on the concentration of ores. Mailed on application.

THE COLORADO IRON WORKS CO.,

Established 1860.

DENVER, COLO., U. S. A.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilean Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

WILL NAME PRICES F. O. B. DEADWOOD, CHICAGO, OR DELIVERED AS DESIRED.

SPECIFICATIONS (Condensed).

- 6 ORE GATES, 24 x 38, rack, hand wheel, frames, bolts, complete.
- 2 ORE BINS, all necessary bolts, rods, nuts and washers.
- 2 GRIZZLEYS, 4' x 10', 1" openings.
- 6 CHALLENGE AUTOMATIC ORE FEEDERS, including hoppers, wood frame, shafts and pulleys.
- 6 HUNTINGTON CENTRIFUGAL ROLLER MILLS, 5' diameter, all fixtures and fittings, complete with wooden frame, shafts, pulleys and gearing.
- 6 COPPER TABLES, 6' x 12', 1/2" copper, electroplated 1 oz. of silver per square foot.
- 2 AMALGAM SAFES.
- 1 BELT TIGHTENER, complete with pulley, boxes, etc., for main belt.
- 1 BELT TIGHTENER, complete with pulley, boxes, etc., for crusher.
- 1 CORLISS ENGINE, built by Fraser & Chalmers, cylinder 20" diameter by 48" stroke, complete in every particular, shaft 10" in diameter, band flywheel 16' diameter, 30" face; weight, 42,000 pounds.
- 3 HORIZONTAL TUBULAR BOILERS, 54" diameter, 16' long, complete with steam drums 30" x 72", mud drums 18" x 66" for each boiler, breechings, smoke box, stack 48" diameter 60' long, all necessary guy rope, half arch fronts, grate bars, cast and wrought iron parts necessary for setting, feed, blow off check and safety valves, gauges and all fittings. Weight, 51,000 lbs. At present these boilers are arranged for setting in one battery. We will make any changes required, furnishing stacks and other items necessary to set each boiler separately.
- 1 HEATER, tubular, 30" diameter, complete, with exhaust pipe.
- 2 NO. 5 KNOWLES BOILER FEED PUMPS.
- 1 BERRYMAN HEATER, 18" diameter by 7' long, copper tubes, 4" pipe inlet and outlet.
- 1 HOOKER VERTICAL SINKING PUMP, 14x8x14, 6" suction 5" discharge.
- 8 ORE CARS, one ton capacity each.
- 1 WATER WHEEL, 50 H. P.
- 1 16" BULLION FURNACE, complete, including 10" Gold Retort, stack and all iron work.
- 1 NO. 5 STYLE B GATES FINE CRUSHER.
- 1 LOT REPAIR PARTS FOR HUNTINGTON MILLS, including roller shells, ring dies, scraper bars, shoes, screens, clamping plates, all new, never used.
- 1 LARGE LOT OF PIPE AND FITTINGS.
- 1 LOT BOLTS, WASHERS, RIVETS AND NUTS.
- 1 LOT OF MISCELLANEOUS SHAFTING, PULLEYS, PILLOW BLOCKS, HANGERS, ETC.
- 120' RUBBER BELTING, 28", 6-ply.
- 58' RUBBER BELTING, 18", 4-ply.
- 150' RUBBER BELTING, 16", 4-ply.
- 70' RUBBER BELTING, 14", 4-ply.
- 2 LOCOMOTIVES, 20" gauge, built by H. K. Porter Co., Pittsburgh, one 6x10 cylinders, the other 8x14 cylinders, both saddle tank.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

THE COLORADO IRON WORKS COMPANY,

ENGINEERS AND MANUFACTURERS OF

Smelting Furnaces and Equipments.

The illustration in this advertisement shows one form of our COPPER MATTING FURNACE, employing hot blast; the air being first treated in proper appliance, is conducted through the cast iron bustle pipes placed along the inside of the caisson plates, through the cast iron adjustable tuyeres. This furnace can also be used for silver as well as copper smelting, by changing lining in crucibles. We build them in any size required.

Cold blast may be used if preferred.

The furnace is equipped with our special cast iron jackets, and our patented system of water-jacketed mantles.

Send for our catalogue, showing many different styles of smelters for the treatment of

GOLD, SILVER, LEAD, COPPER AND NICKEL ORES,

also the latest and best method for the economical use of jacket water (a saving of 80% to 90% guaranteed) by our patented

WATER VAPORIZING ATTACHMENT.

We design, manufacture and erect Mills for Concentration and Amalgamation, Milling, Chlorination and Cyanide Processes. In writing for information, give us the analysis or character of the ore to be treated, to enable us to intelligently arrive at the proper method.

Our very complete catalogue of CRUSHING MACHINERY will be sent on application.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two
years' use am convinced it is the only machine
that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says.
"Will do perfect work and save all the Gold, fine
or coarse, with proper usage. We save Gold readily
that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples
(concentrates) received and are finest work I
have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver
Treatment, Ft. Wayne, Ind., says: "That little
machine is a daisy. The fact that you readily
save values that float on water is to me the most
convincing argument against the wet system."

The Hooper Pneumatic System

Is the only reliable method of treating
mixed, slimy or rebellious ores. Zinc
and lead combinations handled in good
shape where all other processes had
failed.

 Pacific Optical Co., Los Angeles, Cal., Agents for the Brunton Patent Pocket Transit.

All of our latest improvements are embodied in this instrument and it is the result of our 18 years' experience in building balances.
 Among the noteworthy features in the make-up of this balance is the improved adjusting device, herewith shown.

The adjusting device will appeal to the assayer as the simplest and most convenient means of checking the beam, and consists of a star wheel on a threaded arbor, mounted on the center edge back of the beam.
 By turning this wheel backward or forward, it is moved along the arbor and so adjusts the beam to equilibrium.

THEO. HIERTZ & SON, Sole Manufacturers, MONTROSE AVE. AND PARK AVE., ST. LOUIS, MO. Manufacturers of all grades Babbitt Metals, Solder, Bar Tin, Bar Lead, Lead Car Seals, Pig Tin, Pig Lead, Antimony, Copper, Spelter, etc.

P. & B. Ready Roofing.

Practical--because it outlasts tin, iron, shingles, shakes and slate; it is not affected by steam, gases, fumes, acid, smoke, heat, cold or moisture; will not scale, sun crack nor run; is a non-conductor and keeps the building at an even temperature. Anyone can apply it--nails, cement, paint and all necessary appliances for laying go with each roll.

Portable--P. & B. Roofing comes in rolls--compact and easily transported, low freight classification; one roll contains enough roofing to cover 200 square feet and weighs about 120 lbs.

Send for booklet--address department "A."

DRY PLACER MACHINES.

THE PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or re-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.

SEND FOR DESCRIPTIVE CIRCULAR.

THE LUNKENHEIMER

SIGHT FEED LUBRICATORS and OILING DEVICES

are up to date in every particular, and extensively used by intelligent steam users everywhere. Specify them. Write for Catalog.

The Lunkenheimer Co.,

Main Offices and Works: CINCINNATI, O., U. S. A.

BRANCHES:

NEW YORK.....26 Cortlandt Street. | LONDON.....35 Great Dover Street.

THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested by our own and our customers' experience during the past twenty years. They are being used by more than nine-tenths of the prominent American engine builders, who are good judges of lubricators. Many of these have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use, or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our new catalogue, showing our full line, will be sent on application.

DETROIT LUBRICATOR CO., DETROIT, MICH.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with Law.

We print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act passed by the California Legislature. The law is entitled "An Act to Establish a Uniform System of Bell Signals to be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.
MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

ASSESSMENT NOTICES.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of December, 1900, an assessment (No. 2) of Ten (10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 2nd day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
JOSEPH H. MOORE, Secretary.
Office—320 Sansome street, room 24, San Francisco, California.

TANANA MINING COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of December, A. D. 1900, an assessment (No. 2) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, Edward H. Stearns, at his office, Room 801 Claus Spreckels Building, Cor. Third and Market Sts., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of February, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 6th day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
EDWARD H. STEARNS, Secretary.
Office—Room 801 Claus Spreckels Building, Cor. Third and Market Sts., San Francisco, California.

YUBA RIVER GOLD DREDGING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Smartsville, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of January, 1901, an assessment (No. 2) of three cents (3 cents) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 214 Pine street, Room 29, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 5th day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
ALBERT CERF, Secretary.
Office—No. 214 Pine street, Room 29, San Francisco, California.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of January, 1901, an assessment (No. 2) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of February, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 18th day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
N. F. REMINGTON, Secretary.
Office—112 Main street, San Francisco, California.

DELINQUENT SALE NOTICE.

MAY DAY GOLD & SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 5) levied on the 30th day of November, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

An Automobile on an Adobe Road.

"Yes, that looks all right here, but I'd like to see one of those concerns try to go along one of the roads up our way," was the comment of a Colusa county man recently on Market street, San Francisco, as he saw an automobile speeding swiftly up the asphalt pave. Automobiles have become so common now in many of our larger cities as to no longer attract universal attention, and their beauty, use and economy are being generally recognized. But in the minds of many exists the belief, as expressed by our Colusa county friend, that while they are all right on a city pavement, they would be only objects of vexation and derision on the bad country roads. To dispel such belief, we have had engraved the accompanying illustration of what may be styled "bubbling" under difficulties through adobe mud in Lake county, California. It is not a fancy sketch, but an actual photograph of the experience of an automobilist in a trip through northern California last November. The picture tells its own story and does not require any elaboration. The trip covered a distance of 120 miles from Ukiah to Sausalito, and was made in eight hours by P. F. Rockett of San Francisco on Nov. 29, 1900. Fifty miles of the 120 were traveled after night-fall. It will naturally occur to one looking at the picture that a machine that can shove through such roads is a good one when better bits of thoroughfare are reached, and that an automobile that can carry one at the average rate of 15 miles an hour over a rough country in darkness and daylight will win its way to popular use anywhere that wheels can traverse. The photograph from which the accompanying illustration was engraved was furnished by the Locomobile Company of the Pacific, 1255 Market street, San Francisco, and portrays one of that company's machines.

Automobiling Through Adobe Mud, Lake Co., Cal.

In this era of consolidation to destroy competition it is of note that the metal mining industry is one that encourages and supports all others and competes with none.

A new factory competes with established

factories; an additional farm tends to lower prices of farm products; another store cuts into the trade and profits of existing ones; the gold miner, alone, enriches all and competes with none; he, of all pursuits, creates the real wealth, patronizes every other establishment, and, producing nothing that he can consume, affords the best home market for the products of others. The amount of his purchases depends on the amount of mineral development. His work sets in motion and sustains a legion of other industries, all operating to the common good. As a promoter of railroad traffic, as a sustainer of farms and workshops, as a creator of new enterprises, as a customer for manufactures of all kinds, the miner is the best purchaser, vivifying a wide circle of activities. It has been calculated that each underground miner affords employment for ten men above ground, thus putting in motion industrial waves on which ride to profit the merchant, manufacturer, farmer and railroad man. He asks for little, but self-interest suggests to every business man in every capacity that anything that aids the mining industry aids his own business. The value of the miner's patronage is manifest. Whatever helps the miner helps all; whatever represses the mining industry injures to that extent the welfare of the nation. The miner needs no subsidies, concessions, or anti-trust legislation; he does need, however, to have his importance more generally recognized. Were it not for the miner one-half of this entire nation would still be a wilderness and the other half filled with people preying upon one another in the struggle for existence. The miner has created the greatest home market in the world and is thus the foremost factor in all commercial development. When the miner has money to spend everybody in his vicinity is prosperous. And the truth of these patent facts should be recognized in the legislature of every mining State and Territory.

THE most gigantic trade combinations in human history, now forming, offer as their most noticeable figure the fact that the mining industry is the base. The most recent Eastern combination of capital represents \$2,490,942,358; of this vast amount \$862,943,358 is credited to coal mine and allied railroad interests of the Morgan syndicate, \$835,000,000 to the Rockefeller oil and mine properties, and \$793,000,000 to the steel combine.

Thus far there has been no combination of all Pacific coast smelting interests. A British Columbia report, which appears to be confirmed by private advices, is to the effect that four smelters of that Province have combined under the name of the Granby Con. S. & M. Co., Ltd.; capital stock, \$15,000,000. In the absence of details, it is to be assumed that the same idea actuates the formation that previously suggested similar combination in Utah, Colorado and Kansas, viz: centralization of interests and economy of operation.

ON Dec. 15, 1897, the Commissioner of the General Land Office made the following ruling: "In applications for lode claims where the survey conflicts with the survey or location lines of a prior valid lode claim, the ground within the conflicting surveys is excluded; the applicant not only has no right to the excluded ground, but he has no right to that portion of any vein or lode the top or apex of which lies within such excluded ground." This month the Secretary of the Interior, overruling a ruling of the General Land Office Commissioner, decides that certain parts of mining location lines may be laid within or upon other patented lode claims, and mining improvements may be placed upon adjoining public or private land actually claimed, "so long as private properties do not complain."

THE fourth session of the International Mining Congress is announced to convene at Boise, Idaho, July 23, 1901. The original idea of the Congress was an excellent one, and the Denver and Salt Lake sessions were of value; but there is a lack of coherence and interest that does not augur well for its continuance. The Milwaukee meeting was of no avail. If real mining men could continue to believe that their attendance would be productive of benefit they would attend even at some personal sacrifice; but the average miner is too busy a man to go a thousand miles to listen to essays by people who do not know what mining is. If a suitable programme is prepared with reasonable assurance that it will be followed, and it can be made to appear that the "Congress" will be of any practical benefit to the mining industry, miners will help make it a success. Otherwise, herwise.

Stamp Mill Practice.

The extended monograph "Stamp Milling of Free Gold Ores," which as written and illustrated by Mr. Harmon, of Nevada Co., Cal., appeared in its entirety in the issue of Dec. 1, 1900, has, as we expected, attracted unusual attention among millmen. Copies of the issue containing it are exhausted. Numerous criticisms and comments have been received, mostly endorsing the stand taken, though differing from the author in some details. As was said editorially, at the time, the article was not at all "orthodox" in its statements and went against some tradition and precedent. In this issue begins a series of articles on the same general subject by Mr. A. W. Warwick, formerly of California, now of Leadville, Colo. In the article on page 95 he takes issue with Mr. Harmon on the subject of stamp mill foundations, a subject to which some previous attention has been given herein. In next Saturday's issue will appear the second of Mr. Warwick's series—"Power Required by Stamps"—which goes into that subject with unusual minuteness of detail. The whole subject is one of practical importance and personal interest to millmen everywhere. The fact that stamps are of such universal and continued use, and that despite all their faults and the introduction of other crushing devices they continue to be in popular favor, justifies such extended discussion of economy and exactness in stamp mill practice. As one millman writes, regarding the whole subject, "I believe that in building and operating stamp mills the day of rule of thumb is over, and that to make needed improvements we must constantly test and apply instruments to find out what we are actually doing, and not rest content with guessing at it." In the article in the present issue it will be noted that Mr. Warwick is something of an iconoclast himself, and in the succeeding articles of the series it is even more in evidence that he is ready to question any statement, however apparently authoritative, where such statement does not appear to run in parallel lines with actual facts as have been demonstrated by repeated and continuous practical experience.

THE fact that the demand for platinum is increasing, that that rare metal was never before worth so much as at present, and that its sources of supply are exceedingly limited, should act as an incentive to Pacific coast miners and prospectors to make tests wherever it would appear probable that it is present. It is not found anywhere on this coast "in place;" nearly always associated with placer gold, and on this continent is only found in any commercial quantity on this coast. It is not infrequent in the northern counties of California, ordinarily in rocks closely related to serpentine, generally in thin scales, rounded granules or irregular grains from microscopic size to $\frac{1}{4}$ -inch diameter, and of all grades of purity. Chromic iron is always abundant in platinumiferous gravels, both as sand and pebbles. It is not uncommon to find native gold and platinum firmly welded together and with a well-defined line of junction. Ordinarily, where found, the quantity of platinum in the gold contents of gravels is one-fifth to one-half of 1%, though in some cases of gold-bearing black sand on the California and Oregon coast the platinum formed 40% by weight of the gold contents thereof. Platinum is found from San Bernardino county, Cal., along the coast line to the Similkameen district, B. C., where, 120 miles south of Kamloops, near the headwaters of the Tulameen river, are the present richest deposits of the metal. In the Tulameen or Granite Creek district the platinum grains are black and magnetic; the platinum sand of the Similkameen is bright. A well authenticated report from that district is to the effect that a small nugget of platinum found therein had a considerable amount of the mother rock attached thereto, a peridotite mixed with chromite and magnetite. It is probable, should platinum be found "in place" anywhere on this continent, it would be in that vicinity. The unconcentrated sand of the Saskatchewan river, 60 miles above Edmonton, B. C., has assayed three one-hundredths of an ounce of platinum per ton. It is also found associated with the placer gold of the Caribou district, 250 miles north of Ashcroft, B. C. With its sister metals, osmium and iridium, its present enhanced value makes it worthy the attention of placer gold miners.

Trade Treatises.

Through the years this paper, under the head of "Catalogues Received," has noted the salient points of illustrated descriptions of apparatus and machinery sent to this office by manufacturers and dealers, but of late the handsome brochures sent are deserving of a more appropriate title than the term "catalogue," which really means only a list or enumeration of names of things with slight explanatory addition. Accordingly, in future, the heading "Catalogues Received" will be discarded, and the more appropriate one of "Trade Treatises" used in weekly notice of the sumptuous productions that find their way to our desk. Many of those treatises are of unusual value. They give considerable technical information; they are up-to-date in modern mining and metallurgical practice; they are embellished with costly drawings finely engraved and are printed on expensive paper, in many ways being as far ahead of the "catalogues" of a generation ago as an arc light is ahead of a candle. The old "catalogue," meager of information and with a few cheap cuts printed on poor paper, is superseded by a gem of typographic art, the trade treatise, embodying the best and brightest in art, the knowledge of the expert and the experience of the practical manufacturer, giving such detail as to cost, construction and applicability as to enable the prospective purchaser in the most remote locality to form a fair idea of what he needs, how it looks, and what it will cost at the factory.

More than ordinary notice is devoted to this matter because many of those treatises deserve it. The technical information is usually correct, the tables and details have all been worked out carefully and are often the result of years of experience; the "fine writing" and padding is all cut out, and nothing but the essential details appear, they being models of brevity; the illustrations are often superior to those in the first-class magazines and illustrated papers, and such superiority is only secured at great expense. In one received this week are forty-three engravings, some of which in their finished form must have cost \$60 each. They are characteristic in every way of progressive mining and metallurgical industry, and, as such, are to be commended.

CURRENT statement is made of a recent discovery in an eastern Oregon gold mine of a vein 25 feet wide in which from a "streak" of ore 12 inches in width "several chunks of ore, each as large as a man's head, have been taken out, which yield one-third gold." With no more than passing reference to the statement, which may or may not be true, it is a matter of record that a rich ore streak will produce great store of treasure from a very small space. Over \$2,500,000 has been taken from a space "the size of a three-room cottage." From one little "pocket" in the Moose mine, near Alma, Colo., about \$1,500,000 was taken. The same holds good regarding several gold deposits in Placer, Tuolumne and other California counties. The Rhodes claim, near Murphys, Calaveras county, Cal., produced \$250,000 from an area 40x100 feet; ninety pounds of gold were taken out in twenty-four hours. A similar area in the Jamieson claim, Iowa Hill, Placer county, Cal., yielded over \$500,000; the Dardanelles claim, Forest Hill, in the same county, yielded \$2,000,000; near Springfield, Tuolumne county, Cal., single miners' carloads of "pay dirt" panned out \$1000 each. This constitutes one of the charms of mining. Development of a "prospect," proper working of a "mining claim," may make each of its 1500 feet worth more than the most valuable 1500 feet front of property on Broadway, New York.

THERE is such a thing as being too previous, even with an improbable possibility, and the twenty-second century ideas being advanced by some scientists in these first weeks of the twentieth century do not tend to increase popular regard for scientific utterances. Tesla, as usual, pops up with a positive statement that he has established communication with the planet Mars, and a Chicago scientist is out with a discovery which consists in "reducing coal to a gaseous form, sending it through the air on a wireless electric circuit, to be reduced at its destination to a solid coal with all its original properties." This is a little in advance of the ordinary procession of new ore processes, wave motors, etc.

Concentrates.

NO PARALLEL end lines no extralateral rights.

THE maximum grade adopted on the U. P. R. R. is 43 feet per mile.

THE standard sizes for trade catalogues are 3½x6 inches, 6x9 inches and 9x12 inches.

ABOUT 65% of the present gold output is by means other than the hydraulic processes.

MINE SURVEYING does not count as development work in annual assessment work required.

AIR is soluble in water at ordinary atmospheric temperature and pressure to the extent of 1.78%.

IT is possible to frame a block of such shape that it will fit either a round, square or triangular hole.

"MINERAL" is any substance—solid, fluid or gas—obtained by mining or digging under the surface, except water.

NO "mineral rod" or "divining rod" will locate gold or silver ore; these metals do not act upon a magnetic needle.

FULLER'S EARTH is found near Bakersfield, Cal., and other points on the Pacific coast, and is used for clarifying oil and refining petroleum.

THE cost of teaming freight between Red Rock, Montana, and Salmon City, Idaho, 70 miles, is understood to be 20 cents per ton per mile.

THE Missouri-Kansas zinc shut-down is to decrease production. A large percentage of English importation of zinc ore has been from Colorado.

WHERE two or more veins unite, the oldest or prior location shall take the vein below the point of union including all the space of intersection.

THE Utah courts have decided that a mining company therein could condemn land over which to construct a pipe line to convey water to its mine.

WHAT we call a natural law is merely that we have discovered the way a natural force acts, and have stated in exact language its habit of procedure.

THE percentage of gold in hard amalgam is usually in direct proportion to the temperature of the pulp, a little more mercury being required in winter.

THERE is no anthracite coal on the Pacific coast so far as known. There is a limited anthracite coal area in Colorado, and a still more limited one in New Mexico.

DISCOVERY and appropriation are the sources of title to mining claims, and development, by working, as condition of continued ownership until a patent is obtained.

CINNABAR is the most common source of quicksilver. What mineralogists call metacinnabarite and tiemannite (mercuric selenide) also exists, the latter in Piute county, Utah.

IN 1900 there were in California nineteen productive quicksilver mines, fifteen in course of development, forty-one furnaces in operation, and about 1300 men employed.

PAN AMALGAMATION is completely successful in the case of chloridized silver, but only partially successful for the "free milling" silver combinations with sulphur, antimony and arsenic.

THE last three bulletins of the California State Mining Bureau, Nos. 18, 19 and 20, were issued toward the close of 1900. A compilation of their contents has already been published in these columns.

ACETYLENE does not at first burn with a smoky flame, but after 300 hours smoke is formed, the burners attaining a temperature higher than that of the decomposition of the acetylene, the gas decomposing into carbon and hydrogen.

THE Idaho placer location law requires that the locator must place a post or monument at each corner, and, within fifteen days after locating, must make an excavation measuring at least 100 cubic feet for the purpose of prospecting.

THE Russian standard of weight is the pound 409.512 grams. A pood is 40 pounds, 16.30 kgs. The verde is the unit of liquid measure; it holds 30 pounds distilled water at 16.6° C. The archine is the unit of length, equaling 71.12 centimeters.

THEORETICALLY, there is no obstacle to working mines 12,000 feet deep. Mines 5000 feet deep are now being worked, and the other 7000 feet could, probably, admit of a vertical shaft with intermediate landings and separate hoisting engines—a winze on a large scale.

WHERE the locator of a mining claim on Government land fraudulently antedates his location for the purpose of defeating an actual locator on same, such location is fraudulent as against the rightful claimant and also the Government.

IN California a mining claim location must be filed by the locator, in the office of the recorder of the county in which the claim is, within thirty days after the time allowed by law in which to do the annual work upon the mining claim shall have expired.

THE Rio Tinto, Spain, copper mine pays the larger part of its dividends from its by-products, the pyrites averaging 48% sulphur. Sulphur is procurable from such big concerns as the Mountain Copper Co., at Keswick, Cal., and the Anaconda Co., Butte, Montana, but

while procurable the product is not entirely commercially profitable, and for this reason most of the sulphur is mainly allowed to go to waste.

UNDER the U. S. law but one timber claim and but one pre-emption or homestead right can be taken; the only limit to the number of mining claims located by one individual or company is the ability to do sufficient annual assessment work on or for each claim to hold them.

TORTA in Spanish America is the usual word for omelet. It is literally a cake, and "of eggs" is implied. But the miners use it specifically for the "omelet" of wet ground ore seasoned with the necessary chemicals to assemble the silver. In looks it is simply a stupendous mud pie.

PHOSPHATE of sodium has been used with success in keeping mercury in good condition for amalgamating purposes. Unlike metallic sodium it forms no combination with quicksilver. An article on page 42 of the issue of Jan. 13, 1900, goes into this whole subject in a practical way.

BISMUTH is produced in commercial quantities in the Ballard and Penn mines, in Leadville, Colo. It is bought by two Denver firms, to be shipped to Liverpool, where an English firm controls the world's output. The demand is light; probably 100 tons of the refined metal would supply the requirements of this continent for a year.

A "FOOT" of water is understood to be the amount that will flow through an opening 1 foot square under 4 inches pressure, or 1 cubic foot per second flowing through an opening of 50 square inches. A ditch 6 feet wide at the top, 3 feet bottom, 3½ feet deep, will carry from 2500 to 2800 miners' inches water, according to its grade.

TELLURIUM may be distinguished from selenium by the peculiar "horse-radish" odor of the latter when heated. In an acid solution of tellurium oxide sulphuric acid immediately produces a brownish precipitate of tellurium sulphide, soluble in ammonium sulphide, its color distinguishing it from any other metallic sulphide soluble in ammonium sulphide.

THERE are many tests for gold. Among the simplest is to pulverize the ore very fine, and in a test tube treat it with one part nitric and four parts hydrochloric acid, allowing the liquid to stand where it will be well warmed for about fifteen minutes till it becomes clear. Then let a small drop of chloride of tin fall into it; if a purple flash of color be instantly produced gold is present.

THE United States requires that all boilers built for marine purposes shall have all the rivet holes in the shell fairly drilled instead of punched, the longitudinal laps of the cylindrical parts double riveted, to be entitled to 20% additional pressure, and no solid or hollow screw stay-bolt can be used in a marine boiler in which salt water is used to generate steam, unless the bolt is protected by a socket.

IT is not unusual to find oxidization of gold ore to considerable depth, so that there is practically no sulphurets or pyrites in the ore, it being free milling throughout. The Yellow Aster mine, at Randsburg, Kern Co., Cal., affords example of such a case, where at a depth of over 800 feet the ore is reported to be almost entirely devoid of sulphurets and no concentrating is necessary. The mine is also reported to have "not a drop of water in any of its workings," which is, also, an unusual feature.

A 1% SOLUTION of pure cyanide will dissolve a given weight of gold in ten minutes; but the addition of one-one-hundred-thousandth part of sulphur, as a sulphide, to that solution will extend the time to two hours to dissolve the same weight of gold. An abnormal consumption of cyanide is usually associated with low extraction of gold. To reduce a 1% solution to ¾ of 1%, use 3 ounces solution to 1 ounce water; to ½ of 1%, 2 ounces solution to 2 ounces water; to ¼ of 1%, 1 ounce solution to 3 ounces water; to ⅓, 1 ounce solution to 7 ounces water.

GOLD-IRON amalgam occasionally forms, for though mercury and iron do not directly combine, iron is susceptible of amalgamation by sodium amalgam, and where the latter is used in cleaning up iron may be slightly amalgamated in spots. Amalgamation of iron is also noted, at times, in pan amalgamation, where copper and salt are employed. Where arsenite of iron is in the ore, if calcium, sodium and magnesium chlorides were in the mine water used for milling there would result a considerable percentage of iron in the amalgam.

AN "ipse" sale of mining stock in a mining stock exchange is a sale of stock made by a broker to himself, and is distinct from a "wash" sale. A broker may have an order from B to buy 500 shares of Copper Jack, and an order from C to sell 500 shares of Copper Jack at the same figure, and by an "ipse" sale sells the 500 shares to himself for the seller, and earns—that is, charges—two commissions. His argument is that it facilitates business for his clients. In the Exchange he has to bid to within one-eighth of the price that he can pay, and has to offer the stock within one-eighth of the price at which he can sell. It is skating over thin ice, but is done.

AT any time prior to the issuance of a U. S. patent for a mining claim or piece of mining ground, protest may be filed against the patenting of the claim as applied for, upon any ground tending to show that the applicant has failed to comply with the law in a matter which would avoid the claim. Such protest can not, however, be

made the means of preserving a surface conflict lost by failure to adverse or lost by a court judgment in an adverse suit. One holding a present joint interest in a mineral location included in an application for patent, who is excluded from the application, so that his interest would not be protected by the issue of patent thereon, may protest against the issuance of a patent as applied for, setting forth in such protest the nature and extent of his interest in such location, and such a protestant will be deemed a party in interest entitled to appeal.

THE ore of the Mountain Copper Co. at Keswick, Cal. averages iron 38, copper 8, zinc 4, sulphur 46, sulphur dioxide and trioxide and aluminum trioxide 3. The ore, which is a chalcocopyrite, has about 1½ ounces silver and 0.03 ounce gold to the ton. There is a trace of arsenic. It manifestly roasts and smelts well. The ore is roasted in huge heaps in the open air, liberating about one-third of its total weight in sulphur, the residue going to the smelters, producing a matte of about 40% copper, which is shipped to the Atlantic coast for refining. It is understood that there is a profit to the company of about \$2.75 on each ton of ore treated. About 200 tons of sulphur are daily burned out from the ore heaps, roasting in the air.

HOW metals gather in veins where miners find them is a constant subject of scientific discussion. As to the scheme suggested, viz: "in a copper mine where the richer bodies of ore have been taken out and the remaining copper is scattered in small particles through the rock, the rock too poor to work at a profit in the ordinary way, by flooding the mine with water, adding acid, if necessary, inserting widely separated electrodes and turning on the current of a powerful dynamo, to cause the copper scattered through the lean rock to gather where it can be gotten at," it might be made the subject of experiment at the expense of the experimenter, though it is believed that the result would be more interesting than prosperous.

A WING DAM is employed in mining the water-covered bed of a river where it is impracticable or undesirable to divert the water from the entire bed. It extends out from one side of a river part way across the stream, crowding the full flow to the unobstructed side. Usually it is built out about half way across the river, then turned down stream and parallel to the bank till it includes within it the portion of the river bed that is intended to be mined, then, turning toward the river bank from which it started, it tightly completes the inclosure against inflow from the river. It generally includes only so much ground as it is calculated can be worked out before a rise in the river overwhelms and tears out the dam, it being but a temporary structure.

FOR determination of lead in lead ores, weigh one gram of the ore, if rich, more if poor, into a platinum dish, cover with a watch-glass and add 40 or 50 cc. of a mixture of one part sulphuric acid (sp. gr. 1.84) and three parts nitric acid (sp. gr. 1.42). Heat the covered dish on a hot plate until the action of the acid on the ore has apparently ceased. Then remove the watch-glass and rinse into the dish. Add 10 to 15 cc. of hydrofluoric acid to the solution in the dish and evaporate until dense white fumes of sulphuric acid begin to come off. It is better to conduct the evaporation under a hood for obvious reasons. Remove the dish from the source of heat and cool. Dilute to about 100 cc. with water, digest until all soluble salts are in solution and filter, washing first with a 2% solution of sulphuric acid and then with alcohol. Dry, detach the precipitate from the filter paper, burn the latter in a small porcelain crucible, then add the precipitate and ignite. Weigh as lead sulphate and calculate per cent of lead in the ore.

By the term "veins" or "lodes," as used in the mining acts of Congress, is meant lines or aggregations of metal embedded in quartz or other rock in place; both are intended to indicate the presence of metal in the rock. But it is not enough that there may be some indications by outcroppings on the surface of the existence of lodes or veins of rock in place bearing cinnabar or other metal to justify their designation as "known" veins or ledges. A "vein" or "lode" is not known to exist until it has been discovered and located—that is, that its boundaries have been specially marked on the surface, so as to be readily traced, and the notice of location is recorded in the mining district or county in which it is situated. It follows, therefore, that a vein is not "known to exist" in law except by an actual discovery of the vein within a given location. The existence of the location is a matter which every one is legally presumed to know. The existence of a "mine" is not known until ore has been extracted or shown to exist in sufficient quantities and value to warrant extracting within the boundaries of the claim located; until then the location is a "prospect," and the mere existence of shafts, tunnels, inclines and stopes on the vein, no matter how extensive such excavations may be, is not evidence of a mine of value; or, in other words, a "vein" is the work of nature; a "mine" is the result of man's handiwork in disclosing the mineral contained in the vein. A "known mine" may be said to be one which is especially recognized by the natural material having been made visible and productive through workings or exploration, and not until then is it a "known mine" within the meaning of the statute. The term "mine" is generally equivalent to a "worked vein," for by working the vein it becomes a mine. The U. S. statutes intend that a "known" mine should be synonymous with an operated mine.

A New Mining Region.*

Written for the MINING AND SCIENTIFIC PRESS
by DON MAGUIRE.

Hitherto mining in Utah has been confined to that part of the State lying south of a line drawn from east to west through Salt Lake City. The two Cottonwoods, Bingham, Ophir, Camp Floyd or Mercur, Stockton, Marysvale, Frisco, Park City, Dry Canyon, Silver Reef, American and Luck canyons are the names that off and on for thirty years have been known as the mining districts of Utah. The new century opens with a new locality for mining in this State, comprising a great part of Box Elder county.

The area of Box Elder county, Utah, comprises about 6000 square miles, a large part of which is mountain, lake and desert. In the northwestern part of the county, in what is known as Park valley, a number of gold veins have been discovered during the past two years, and there is now running on one of these properties, owned by Dr. Kurg of Salt Lake, a small quartz mill which turns out a gold brick valued at \$1000 every week. The success that has attended the building and operation of this little mill is now encouraging other property holders there to develop their claims and construct other mills than the one now running.

The veins in Park valley are strong quartz veins, with clear, distinct walls in granite and porphyry and also in slate, which latter formation is the cap rock of much of that locality. Park valley lies about 15 miles northwest of Kelton, a freight station on the U. P. R. R. The mountains there are less than 8000 feet above sea level and comprise a part of what may be termed the Kelton range; abundant grass, fuel and water are found there, and at present about 100 locations have been made in the district. The work so far done does not do justice to the promise of the veins exposed, and when capital and experience within the next two years are brought to bear upon Park valley it will become one of the active producers of Utah.

North and west of Brigham City, in the main range of the Wasatch, a number of good properties running high in gold, silver, lead and copper are held by local prospectors, and many of them if vigorously worked would no doubt become good mines. In this part of the county, north of Brigham City, there is a mine known as the Gold Consolidated. It is a large group, and on it about \$160,000 has been expended. There seem to be very large bodies of high-grade ore there, but as yet but a small tonnage has been worked from this mine; the management is in the hands of Colonel Baker of Ogden and Chicago.

The pivotal point, however, of mineral wealth in Box Elder county centers in Sierra Madre mountain, one of the highest mountains of the Wasatch range and which rises north of Ogden about 12 miles and 7 miles south of Brigham City. This mountain is bold and rugged; its steep sides and western slope rise up almost perpendicularly and expose one of the most interesting series of formations to be found on the American continent. Deep, black canyons, running far into the granite measures and needle-like pinnacles, rise up thousands of feet into the cold, bleak atmosphere of the higher regions; a stunted growth of fir and scrub pines clothe the north slopes of its deep gorges, and near the summit, where the blue limestone belts lie, a limited number of monster red firs are scattered along the mountain for a distance of about 4 miles, and their twisted and gnarled boughs show the effects of as much as five centuries of battling with the elements. So little has man visited this high and lonely solitude that, although within 50 miles of Salt Lake City, the big horns, or mountain sheep, still find a home there, and the mountain eagles have hitherto nested in its aeries as the last one spot where man's foot was never to tread.

The formation of this mountain near its base is granite or syenite and gneiss, also porphyry. Midway toward the summit lies a belt of Cambrian or Weber quartzite, 1800 feet in thickness, on the upper contact of which rests a measure of clay slate, and capping that about 900 feet of Carboniferous limestone; above this a measure of chloritic schist, and still above this a third measure of the later quartzites.

The ores existing in this mountain are gold, silver, copper, lead, zinc, antimony, iron, nickel, cobalt, molybdenite and uranium.

The chief ore bodies so far discovered are in very prominent gold-bearing fissures in the gneiss measures and silver-bearing lead ores in the Carboniferous limestone and clay slate near the summit of the mountain. For thirty years the precious metals were known to exist here, but it was only in 1897 that vigorous steps were taken to develop the mineral veins that rise there to the surface.

In 1897 the first work of opening the King Solomon vein was begun, and the following year the El Dorado vein was worked upon. This El Dorado vein is a gold and silver-bearing lead vein, lying between clay

slate and blue lime, and in places sending immense bodies of ore into the blue lime above. The lead existing here runs from 20% to 85%, silver to the value of thirty ounces and from 2 to 6 dwts. gold.

This vein, where it is now being worked in the El Dorado, is from 5 feet to 17 feet in thickness and lies almost like a blanket vein, dipping into the mountain at a pitch of about 14° and rising with the country from N.W. to S.E. almost 4 miles, the entire length of which shows values sufficiently high to make it pay for working.

The El Dorado mine is situated on the west side of Sierra Madre mountain, about 900 feet below the summit, known as El Dorado peak. The King Solomon fissure breaks up through the quartzite into the slate and lime at this point, and seems to unite with the El Dorado flat vein.

At this point there seems to be a sort of mineral axis from which radiate forth the strong lines of either vein, and at the point where work began on the El Dorado clear bodies of silver-bearing lead ore that runs 70% lead to the ton comes clearly to the surface, continuing in strength and richness as work goes down, until at a depth of 250 feet from the mouth of the incline the vein presents one of the strongest and most beautiful ore bodies ever opened in any mine. Within the last twelve months about 800 feet of work has been done on the El Dorado, chiefly in sinking an incline and running lateral drifts on the ore body to the right and left from the main incline.

At the face of the incline, 250 feet from the adit, copper, in the form of chalcopryite, begins to show in the clear galena, and conditions would indicate the rise of considerable of this metal in the working of this vein as depth is gained. At present writing there is considerable ore exposed in the El Dorado workings in a small area, when compared to the extent over which the well-defined ore bodies may be traced along the mineral zone.

The most discouraging feature of these mines was the conditions existing when work of development first began. For a distance of more than 9000 feet the surface of the country and approaches presented a succession of steep cliffs and precipices; points hundreds of feet apart had to be united by building up masses of masonry and by hanging bridges, and at other points immense bodies of quartzite had to be blasted away—and all this to construct a good pack trail for a donkey train.

In the spring of 1900 work on the construction of an aerial tramway began. To install this the work was doubly difficult. The illustrations on the front page portray the difficult character of the country through which this line was built. Several months were required in its construction. The pattern of tramway placed here was the Hallidie, furnished by the California Wire Works of San Francisco, Cal., and it was only in the last days of December that it was put into commission, carrying down ore from the El Dorado mine to the foot of the mountain.

I send you herewith two photographs showing the kind of country referred to, over which the El Dorado tramway has been built.

The ore thus transported over the line is divided into three classes—first, second and third. First and second class ores may be treated by smelters without further handling, but third class ore must be concentrated, as the lead value falls to a percentage of from 15 to 25.

The nearest railway point from the lower end of the tramway is at Hot Springs, 2 miles away, on the O. S. L. R. R., and also the U. P. R. R.; from the Hot Springs to the smelters south of Salt Lake City the distance is 52 miles and the freight rate \$2.50 per ton; for transportation by rail from the end of the tramway to the railroad the cost of transmission by wagon is 60 cents per ton, and the cost of transmission over the tramway is 17 cents per ton; in all it costs \$3.27 to land ore from the mine to the smelter. Adding smelter charges to the above, the ores from the El Dorado, with lead at \$4 per 100 pounds, can earn dividends on its output. The other mines of this mountain are the Vulture, Santa Maria Consolidated, the Uwanta Group, Cashings, Blue-Eyed Nellie, Defiance, Manila, Sampsons, Aguinaldo, Ben Hur, Bengal Tiger, Broken Bow, King Solomon, Eulalea and Kilkar. The above groups are owned mostly by men who are quite able to develop them, and the summer of 1901 promises to see Sierra Madre mountain one of the most interesting and profitable in the State of Utah, considering the amount of money so far spent upon it.

At the foot of the mountain and at its west base, overlooking Great Salt Lake, lies a little town just springing into life, called Lagansville, named in honor of Dr. John Lagan, a resident of San Francisco, who has been one of the strong forces in the development of this mountain. The town as yet is in its infancy, comprising the necessary buildings constructed by the El Dorado G. M. & M. Co.

As to Sierra Madre mountains' future there can be but little doubt. In the properties now located there are seven fissure veins, one blanket vein, three lenticular veins, and of the above eight carry gold alone and the others show values in gold, silver, copper and lead. The locality in its geological make-up is an ideal one for strong mineral veins, and for mineral values in silver, lead, gold and copper its upper measures are counterparts of the region in

and around Batopilos in Mexico and also that of Zacatecas. At Cottonwood, in the same range, 30 miles from Salt Lake City, where the same measures extend and where similar surface conditions exist, \$17,000,000 has been taken in thirty years from a less area than that contained within the lines of the El Dorado property.

The district thus known as the Sierra Madre mining district, so lately brought to the notice of the world, shows what may lie at the feet of a busy hive of humanity for years without being known to be of value. Sierra Madre, like Cripple Creek, for forty years was passed by as a spot wholly unworthy of consideration as a mining country; five years hence men will tell of how in 1899 and 1900 they could have purchased for a trifle property that then shall have become the peer of present great producers.

Pressure of Water.

The following table shows the pressure of water in pounds per square inch for every foot in height to 100 feet; and then, by intervals, to 500 feet head. By this table, from the pounds' pressure per square inch, the feet head is readily obtained, and vice versa:

Feet head	Pressure per sq. inch	Feet head	Pressure per sq. inch	Feet head	Pressure per sq. inch	Feet head	Pressure per sq. inch	Feet head	Pressure per sq. inch
1	0.43	30	12.99	59	25.55	88	38.12	117	50.68
2	0.86	31	13.42	60	25.99	89	38.55	118	51.11
3	1.30	32	13.86	61	26.42	90	38.98	119	51.54
4	1.73	33	14.29	62	26.85	91	39.42	120	51.98
5	2.16	34	14.72	63	27.29	92	39.85	121	52.41
6	2.59	35	15.16	64	27.72	93	40.28	122	52.85
7	3.03	36	15.59	65	28.15	94	40.72	123	53.28
8	3.46	37	16.02	66	28.58	95	41.15	124	53.72
9	3.89	38	16.45	67	29.02	96	41.58	125	54.15

The Gardner Electric Drill.

In the issue of May 26, 1900, appeared an accurate description, accompanied by illustration, of the New Era electric drill, manufactured in Denver, Colo. The original company has since been supplanted by the Gardner Electric Drill & Machinery Co., the machine now being known as the Gardner electric rock drill. The home office of the company is in Denver, where it has equipped a thoroughly modern machine shop of sufficient capacity to turn out fifty drills per month. The right of sale and manufacture has been granted the California Electric Co., in San Francisco, for the territory embraced in California, Oregon, Nevada and Alaska. Negotiations are pending with parties in the East to provide for the manufacture of this drill in that section. It is stated at the Denver office that the Gardner drill is in operation at thirty different mines in the Middle and Western States; that it can be seen operating at the Pro Patria tunnel, Rico; the Bessie mine, Telluride; the Edgar Con. mine, Idaho Springs and other locations in Colorado; and on various properties in Wyoming, California, Oregon, Montana and Mexico. By reference to the technical description referred to full information can be obtained as to the mechanism of the drill, its weight and power required.

Cyaniding in Mexico.

TO THE EDITOR:—This republic has a "Mercur, Utah, district" as a cyanide camp in El Oro, State of Mexico, the ores being easily amenable to cyanide treatment. The El Oro Mine & Railway Co. treat 9000 tons ore per month by the cyanide process; the Esperanza Co. treat 6000; at the Mina Leanen, which belongs to the British Gold Mines, Ltd., 2000 tons per month are treated. The Mexico Mine Venture Syndicate, owners of the Mina Mexico, are preparing to treat about 3000 tons per month, a total right here of 20,000 tons per month of ore treated by the cyanide process.

All the ores in this district are found either in the contact between the andesite and slate or else in the slate proper. Cyaniding is understood very well in this district and is done in an up-to-date fashion, the slime treatment, which is done by agitation, with compressed air, being in my estimation a step in advance of the general practice in the United States.

El Oro, Mexico, Feb. 1, 1901.

GRINGO.

* See illustrations front page.

An Aid to Gold Dredging.

To get at the gold on the bedrock, and out of the crevices therein, is one of the things that often puzzle the operator of a gold dredger. From New Zealand, the home of the gold dredging industry, come details of a pneumatic rock scraper designed for the purpose mentioned and to assist in the removal of large rocks and stones below water level. It differs from the ordinary gold dredger in having three instead of two pontoons, thus providing two wells. One of these wells accommodates the bucket ladder, while the other well is set apart for the pneumatic apparatus, which consists of an iron tunnel swinging upon an axle, which allows the lower end or mouth of the tunnel to be raised or lowered at will, being able to reach to a depth of 65 feet. The mouth of the tunnel is enlarged to a size sufficient to cover a boulder and allowing the workmen to work around it. The water is expelled and kept out of the tunnel by pneumatic pressure, and

Where the claim offers a soft bottom, easily scooped up by a dredge bucket, the gold is cleaned up with ordinary care to a degree of exhaustion to make the employment of other means for the recovery of the gold left in the bottom unprofitable. But the case is entirely different where a hard rock bottom is met with. Where such a bottom carries gold it is almost exclusively contained in crevices of varying depths. In these cases the practice is to keep the buckets going so long as they will bring up any rock, and, when they cease to do so, to declare the bottom cleaned up, though more gold be left behind than was raised by the buckets. There is, of course, no means of knowing what is the quantity of gold that is lost or missed in this manner. The quantity raised, however great, is no index to that left at the bottom, and no steps have been taken to ascertain, however roughly, what the loss really amounts to.

After all, this is only a small item in the waste of gold for which dredging may be held to be answerable. Dredging companies have come to grief because the dredger could not raise the gold that had been proved to be in the rock by previous prospecting. The rock scraper described is

one stood in the drift, became quite distinct if the forehead was pressed against the wall rock.
Leadville, Colo. PERCY MCGEORGE.

The cost of a horse power per hour, in different sorts of motors, has been studied by M. Charvet, who asserts that a French laborer working eight hours in turning a crank at a wage of about 70 cents per day produces one horse power hour at a cost of 85 cents. An ox turning a horizontal bar 13 feet long (as in some grinding mills) produces the unit at a cost of 23 cents. A horse doing the same kind of work travels faster than the ox, and the unit of work costs a little less than 20 cents. A 6 H. P. steam engine (working 150 days each year and ten hours per day, as is customary in farm work) produces the unit of work at a cost of about 4 cents. The gas or oil engine is more economical in operation, but its work in France costs about 7 cents on account of customs duties. The windmill produces its unit of work at 2 cents, but M. Charvet concludes that the most economical form of motor is the water wheel. He argues that a water wheel whose first cost is about \$160 per horse power produces a unit of work

when the bottom is reached, or at any other stage of the work, the men enter the tunnel to do whatever may be required, whether it be the removal of stones or scraping up the bottom. To raise any material to the deck of the pontoons a truck running on rails, as shown in the accompanying engraving, is used. The tunnel is supplied with electric light, and telephonic communication is provided between the men at the bottom and those upon the deck of the pontoons. The scrapings off the bottom are landed in a receptacle provided for the purpose.

Work is begun by setting the bucket belt in motion, and when a boulder is met to obstruct the work the ladder is raised, the dredger shifted sideways, the pneumatic tunnel lowered, and the men go down to remove the obstruction. When bottom has been reached and a sufficient space cleaned the same process is repeated. Men descend, when the tunnel has been lowered to the rock and the water expelled, to clean out the crevices, sending up the wash and gold in the truck.

There is the objection that in swiftly flowing rivers the rock, when cleaned up by the dredge buckets, will be covered by several feet of tailings before the pneumatic tunnel is placed in position, an objection not yet satisfactorily answered.

The Mines Record points out that the question of raising the gold to be saved has been much neglected.

designed to cope with the difficulty. The pneumatic tunnel of the rock scraper is intended to deal with boulders. A wire rope, with chain attachment, is provided outside the tunnel, as shown in the accompanying engraving, and marked "Boulder Line." This boulder line is attached by the man at the bottom to the stones to be removed. The line, or two-wire rope, is worked from the deck, drawing the stones back on cleaned-up ground, where they are deposited clear of everything. If the stones are too large to be bodily shifted they can be blasted.

Sound Heard Through Rock.

TO THE EDITOR:—In "Concentrates" of Jan. 26, it is said that hammering and drilling have been heard through 180 feet of rock. In the Antioch tunnel, in Breece hill, we have heard a 2-inch air drill in Ibex M. Co.'s workings, 511 feet below us, and about 260 feet north, or 573 feet in a right line. From a winze sunk in a crosscut from the same tunnel, we have heard a 2½-inch air drill in the Yak M. & Tunnel Co.'s tunnel, about 610 feet below us, and about 450 feet west, 758 feet in a right line. Breece hill, above these workings, and for at least 300 or 400 feet below, is composed of hard, close-jointed quartz porphyry. The sound of the drilling, barely audible as

at a cost of less than 1 cent, and that turbine wheels are even more economical.

TWO ELECTRICAL FURNACES at McGill University, Montreal, Canada, have a capacity of 110 volts, and are large enough to take a current of 100 amperes. These furnaces, with heat of 3000° to 4000° C., split up compound substances into their component parts, with important results for commercial purposes. They will also be used for the manufacture of diamonds, a process discovered by M. Moissan. The study of the diamond fields of South Africa convinced him that great heat and great pressure have been the agents that turned carbon into the diamond. He therefore fused in the electric furnace carbon and iron at enormous heat, and then cooled the compound off rapidly, thus subjecting the carbon mixed with it to tremendous pressure, resulting in the formation of diamonds, answering all the tests of the natural gem. The artificial product is, owing to size, of no commercial value.

A SOLAR MOTOR is reported in operation at South Pasadena, Cal. The device comprises a funnel-shaped reflector 33½ feet in diameter at the top and 15 feet at the bottom, containing on its surface 1788 mirrors. This reflector is set on two fixed supports in such manner that it may follow the movement of

the sun, and is kept in focus by clockwork. The adjustment of the mirrors is such that the sun's rays are concentrated on a boiler, tubular in form, 13½ feet in length, with a capacity of 100 gallons of water and 8 feet additional for steam space. The concentration of heat is capable of raising the temperature to several thousand degrees, but the boiler is prevented from being superheated by the water within it, which is brought to 350° or 400°. The engine is fed and the supply of water in the boiler is maintained automatically, and the only attention necessary to operate the machine is to adjust the mirror to focus and set in operation in the morning. This motor is stated to be pumping from a large underground tank at the rate of 1400 gallons a minute.

Stamp Mill Foundations.

Written for the MINING AND SCIENTIFIC PRESS by A. W. WARWICK.

No one has had the temerity to criticize Dana Harmon's paper on the "Stamp Milling of Free Gold Ores." Nor is anyone likely to do so, taking the paper as a whole. The personal experience of such a man as Mr. Harmon is of the highest value, but when we get so much good horse sense wrapped up in a frisky literary style we derive pleasure as well as profit. I hardly believe that any millman will dissent from the general tenor of that paper.

All writers on stamp milling (even Mr. Harmon) apparently insist that the mortar blocks must be set on solid rock, the rule seeming to run, "The mill site must be chosen with reference to the foundation; if the most convenient place has no rock bottom it can not be used, but an inconvenient place with rock foundation will be all right." This idea seems to me to be all wrong. I would lay down a general rule to the effect: Build the mill in the most convenient location; if no natural foundation exists, construct one.

The writer saw a small stamp mill being erected about three years ago on a sand bottom, and quite loose sand at that. He also saw the mill running, and a smoother running mill has rarely been seen. The people putting in the mill had none too much funds and the construction had to be cheap. All that was done was to sink the customary battery block pit, which was widened at the bottom until it had an area of 5x8 feet. The sand at the bottom was wetted and rammed. On this bottom cross pieces of old railroad ties were laid (Fig. 1) and all cracks and

FIG. 1.

spaces filled and rammed with sand. Above this another layer of ties was placed, also rammed with sand, and at right angles to the bottom layer. Another layer of cross packing finished the foundation. The whole was covered with sand as usual and the battery block put in place. After running the mill for several weeks not the slightest trace of subsidence could be detected. This style of foundation is by no means a model one, nor would one recommend it as a permanent job. Still, it did its work during the time it was required, and surely went to show that a rock foundation is not a sine qua non.

About two years ago the writer put up a 10-stamp mill in San Bernardino county, Cal., the conditions requiring the mill to be situated at a point not only where there was no rock bottom, but where there

homogeneous sand—thus violating, apparently, all rules given for battery foundation. The pit was widened out at the bottom until it had an area of 5x12 feet, or 60 square feet (Fig. 2). On this bottom was placed (and well rammed) a Portland cement concrete, made by mixing four parts sand, one part Portland cement, two parts broken granite, this foundation being 30 inches thick. The concrete was kept wet for several days and a cap consisting of one part sand and one part Portland cement was given and struck off quite smooth and level, also being kept wet for several days while hardening. In two weeks the foundation was as hard as granite, and when struck gave a clear ring, showing that it was solid and ready to receive the mortar blocks. Before laying the mortar blocks the concrete was covered with a couple of skins of 2-inch plank laid crosswise. To receive the mud sills a series of concrete piers was built, with h. d. bolts going through them. These piers had an area at the bottom of about 3x3 feet, narrowing up to 16x16 inches. The battery blocks and mud sills were placed on this foundation in the usual way, and when the mortars and battery frame were in place, about a month after, not the slightest subsidence was detected after very careful tests. When the mill finally got to work—about seven weeks after the concrete was in place—it ran as smoothly and gave as little trouble as if it were built on a solid granite foundation. For the whole work eleven barrels of Portland cement (Belgian) were used.

In making an artificial battery foundation, observing the following rules will insure success:

1. Let the foundation be deep enough so that the bottom is of a homogeneous character. A foundation partly on rock or partly on gravel will surely fail.
2. When a uniform bottom is obtained, area and not depth is required. Allow 25 square feet for a 5-stamp foundation, or 60 square feet for a 10-stamp mill.
3. Use only the best Portland cement. Remember, a concrete made up of four parts clean, sharp sand, two parts broken granite and one part Portland cement is stronger than concrete made of 6 parts sand and one part cement.
4. The concrete foundation should be not less than 30 inches thick.
5. Finish off with one part sand and one part cement.

Notes on Cheap Gold Milling in Mexico.*

By H. F. COLLINS, Chiapas, Mexico.

The following notes on the cheap milling of a soft, low-grade ore body in the State of Chiapas, Mexico, may be of interest. The ore body in question was worked, not by itself, but incidentally in connection with a large extraction of concentrating ore, and one 10-stamp battery of a 30-stamp mill used for re-crushing tailings, and provided with copper plates, was set aside for the treatment of this particular ore, of which (during a period of seventeen months) 10,274 tons, of 2240 pounds each, were handled:

DESCRIPTION.—The ore body consisted of that portion of a mass of decomposed garnet rock of igneous origin, which, near its contact with another igneous mass, composed chiefly of the mineral wollastonite in a nearly pure state, had been permeated by solutions, depositing irregularly, throughout it, quartz, chalcedony, silicate and carbonate of copper, gold and much hydrated oxide of iron. The portion thus impregnated and rendered gold-bearing averaged about 30 feet in width, and assays throughout this width varied from 0.05 ounce up to 0.65 ounce, and in one case even 0.9 ounce, the average being about 0.20 ounce of gold per ton of 2240 pounds. The contact zone was exposed on the top of a narrow neck joining two very steep hills, and ran at right angles to the axis of the ridge, so that at the surface it was only about 40 feet long.

MINING.—The accessible end of the ore body was at the top of a cliff about 100 feet vertically above the end of a branch track from the mill. From this point a short drift was run, about 40 feet below the summit of the ridge, a raise was put up, and a shoot was arranged, so that the stuff could be quarried in open cut, readily loaded into the car running in the drift and, from this car, dumped over the cliff. Since about 90% of the material broken was friable, ferruginous garnet rock, and only 10% was quartz and chalcedony (both of which,

mostly in large blasts, made to loosen the mass. The fall from the top to the bottom of the 100-foot cliff effectually broke up most of the large pieces of rock. At the latter point the heap was shoveled into cars and trammed to the mill, a distance of some 350 yards.

MILLING.—The material was tipped over a grizzly, 1.5 inches between bars. The proportion of quartz, etc., which did not pass through was comparatively small, one boy, with occasional help, being able to spall the lumps and shovel them again through the grizzly. Thence it was delivered to the mill bin, which held about twenty-four hours' supply for the battery.

The stamps weighed 750 pounds, and dropped 5 inches 100 times per minute. Shoes and dies were of Sandicroft forged steel. The screens were of copper wire, and at first of twenty-mesh size; but as the difficulty of saving the gold became evident, the ore was crushed more finely, first through thirty-mesh screens and finally through forty-mesh screens. There were no inside plates, though quicksilver was fed into the mortars; and it proved exceedingly difficult to keep in condition the outside plates (silver-plated), both green scum and black spots forming rapidly and persisting obstinately, while there was a strong tendency to "scour." Of the gold shown to exist by assay, the percentage extracted was low—only 30%. Experiments with cyanide, however, showed an enormous cyanide consumption, with an extraction not exceeding 50%, which was not considered encouraging. A large number of panning tests showed that the proportion of coarse gold obtained in the heavy black magnetite sand was small, and that most of the particles were visibly "coated" with hydrated oxide of iron. The bulk of the gold, however, was very fine and "rusty," intimately intermingled with the hydrated oxides of iron, among which, apparently, it had been precipitated. In the testing of samples from some of the richer parts of the deposit, an exceedingly fine brown powder adhered to the bottom of the pan; and although, by reason of its weight, presumed to be gold, manifested none of the characteristics of that metal until heated to low redness, when it acquired a metallic luster. The ignited powder yielded iron to hydrochloric acid in a test tube, and was evidently precipitated gold, intermingled or coated with precipitated oxide of iron. Ground with quicksilver, it refused to amalgamate completely; and, treated with cyanide before heating, it dissolved very slowly. This is clearly another instance of gold coated with oxide of iron, of similar nature to that described in the paper of Messrs. Chatard and Whitehead read at the Washington meeting of the Institute.

COST.—The cost of mining and milling was so low that, in spite of the imperfect extraction, this low-grade ore, yielding an average of only 0.0659 ounce of fine gold, was worked at a profit of nearly 80 cents gold per long ton. The mining, though it involved two and sometimes three handlings, was done for 20.5 cents per ton of 2000 pounds; and the milling, including all current repairs and due proportion of mill salaries, for 17.6 cents (no allowance, however, being made for power, since the whole mill, of which the ten stamps formed part, is driven by water power). The cost of milling would have been lower but for the isolated situation of the camp, freight to which from New York comes to about \$40 gold per ton. The total quantity treated and its yield may be recapitulated as follows:

Quantity of ore treated.....	10,274 tons of 2240 lbs.
Total yield of melted bullion.....	846.36 ozs.
Average fineness.....	798.5 ozs.
Total yield of fine gold.....	677.44 ozs.
Yield of fine gold per ton of 2240 lbs	0.0659 oz.

The following table gives the detailed cost in Mexican silver of treatment per ton of 2240 pounds and cost per short ton of 2000 pounds in United States currency, with exchange at 48 cents to the dollar (about its average during the past two years) being added for comparison:

	MINING.		U. S. currency,	
	Mex. silver,	ton of	ton of	
	2240 lbs.	2000 lbs.		
Cost of breaking and tramming—				
Labor	\$0.4457		\$0.1909	
Explosives	0.0337		0.0145	
Total cost.....	\$0.4794		\$0.2054	
Labor—				
MILLING.				
White, foremen, etc.....	\$0.1128		\$0.0483

Mining and Metallurgical Patents.

Patents Issued February 5, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

CHAIN CONVEYOR.—No. 667,174; A. M. Acklin and W. J. Patterson, Pittsburg, Pa., assignors to Heyl & Patterson, same place.

Combination with endless chain having overlapping links, of polygonal drivewheel therefor, peripheral blocks bolted thereto provided with lugs located at angles of wheel alternately at opposite sides of plane perpendicular to wheel axis to engage rear ends of chain links.

WELL CASING PERFORATOR.—No. 667,180; E. J. Bates, Bakersfield, Cal.

Head provided with coupling for attachment of stem with longitudinally inclined stationary leg, curved extension constituting rest and runner, movable leg pivoted at upper end within head, pair of cutter-supporting plates detachably connected to lower ends of legs, mounted between plates, cutter-operating cable connected to cutter, and fragile binder for connecting cutter during advance of tool through well casing.

EXCAVATOR.—No. 667,314; O. Hetlesæter, Chicago, Ill.

Combination of linkwork bucket arm comprising pair of longitudinal members, one pivotally supported, connections at one end to excavator bucket, at other traverse link; hoisting cable connected with traverse link, exerting power in line other than that of line through pivots of link; retracting cable attached to second longitudinal member; guide for retracting cable located on longitudinal member at point thereon lying upon same side of pivotal point of support thereof, as lies traverse link; pivoted crane

box for reception of flanges, horizontal shaft 16 hung for supporting member; turret for supporting crane; means for adjusting crane upon the turret in direction of length of crane; horizontally extending part fixed relatively to crane, having near its periphery means for guiding cables so they shall be trained respectively to opposite sides of axis of crane, driving mechanism for operating cables.

ADJUSTABLE COAL OR ORE SPOUT.—No. 667,335; J. L. Record, Minneapolis, Minn.

Discharge apparatus for coal and ore bins, combination with stationary chute, of spout having upper end arranged to partially surround mouth of chute and receive discharge therefrom, bolster arranged beneath chute for supporting receiving end of spout, standards on bolster to which spout is pivotally connected to allow free end to be raised and lowered, base on which bolster is mounted, spindle connecting them permitting horizontal rotation of bolster and spout, means for raising and lowering outer end of spout elevated to substantially vertical position when not in use.

MACHINE FOR SHARPENING OR SHAPING DRILLS.—No. 667,187; A. Carstens, Leadville, Colo.

Combination of power hammer, bed having feed opening in line with head of hammer, die block having opening in line with feed opening and hammer head, die formed at outer end of opening, dolly holder, dolly therein, between die and hammer head, means to feed work forward to dolly, rearward to die.

ORE CONCENTRATOR AND SEPARATOR.—No. 667,514; G. J. Frey, Oakland, Cal.

Combination with suitable closed box, interior box 13 within box, adjustable rods 9, 10, 11, 12 attached to closed box suspending corners of interior box, plurality of inclined pans within interior arranged one above the other, upper end of each pan extending beyond lower end of one immediately above, provided with longitudinal flanges, inclined grooves in interior

on closed box, pitman rods 19 and 20 connecting opposite ends of interior box to shaft, loosely-fitting bolt 23 connecting bottom of interior box with exterior box, arc-shaped corrugated pieces 24 and 26 secured to opposite ends of interior box and outer box respectively, series of partitions within pans, corrugated pieces made up of series of independent adjacent strips.

ORE CONVEYOR.—No. 667,192; W. R. Craig, Shelby, Ala.

The combination with series of consecutively arranged buckets, bottom of each bucket having forward end formed into hook, rear end provided with heel, edge of heel formed into cylindrical sleeve, each side of bucket bent at right angles to bottom, perforated to register with bore of cylinder, strengthening strip secured to each side piece, each end perforated, intermediate portion provided with offset, axle through each, end provided with roller, track for roller.

METHOD OF TREATING CONVERTER SLAG PRODUCED IN BESSEMERIZING COPPER MATTES.—No. 667,367 G. Mitchell, Jerome, Ariz.

In smelting copper ore in cupola furnace, continuously drawing off slag and matte produced into forehearth of furnace, allowing matte to settle in forehearth, removing portions of it from time to time, bessemerizing portion so removed, pouring the converter slag resulting from the bessemerizing into molten matte and slags as they come from cupola, so that matte and slag of cupola and converter slag will flow into forehearth at substantially same spot, thereby raising temperature of converter slag without use of additional fuel, to point where matte prills contained in converter slag are liberated and settle to bottom of forehearth.

OIL WELL PUMPING POWER.—No. 667,368; W. H. Norton, Scio, N. Y.

Pair of sills, blocks located at top and bottom, shaft power wheel supported by blocks, second shaft supported at right angles to power wheel shaft, bearing formed on upper block in which bearing inner end of said shaft is journaled.

STAMP DIE.—No. 667,415; F. White, Nevada City, Cal.

The object of this invention is to provide a cup or cover of hard metal which is fitted over the dies of stamp mills and receives the blows and wear of the stamp and the ore, so that the die itself will not be worn away; but after the caps have been so worn as to be useless, they can be removed and new ones fitted on, thus saving the lower part of the die.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

The Alaska Industrial Co., Supt. Scott, is pushing work on its properties at Copper mountain, in the interior of the main Prince of Wales island and on Dall island.

ARIZONA.

COCHISE COUNTY.

Native copper is reported opened up in No. 3 crosscut in the Black Diamond, near Tombstone, at a depth of 470 feet.

GILA COUNTY.

The new furnace of the Old Dominion, at Globe, is running successfully.—The Troy Copper Co. is pushing work on the Troy group, near Troy; the shaft, now down over 275 feet, will go to the 300-foot level. Crosscutting will be started at this depth.—A body of sulphide ore 10 feet wide is opened at a depth of 125 feet in the Climax No. 3. Ore is said to run 6% copper.—The new 22 H. P. gasoline hoist, shafting, pipe, water tanks, mine car, rails, etc., are going in at the Black Copper, near Globe; ten men are employed at present and thirty more will be put on soon.

GRAHAM COUNTY.

A strike of good ore is reported made on the Comstock, in Bonanza gulch, 5 miles from Morenci.

MOHAVE COUNTY.

Machinery will go in on the De la Fontaine, at Stockton Hill.—The Jack Little mines, at Campbell, are bonded to Eastern men.—The Schylkill Co. will put in a 100-ton concentrating plant on its property at Chloride; Supt. Thies.—At the Golden Gem and C. O. D. mines, near Kingman, the furnaces are being converted into oil burners, and at the Tub and Prince George mines oil burning engines will go in.—An electric plant will go in on the Maguire ranch, south of Kingman, to supply power to the Gold Road mines, near there.

PINAL COUNTY.

The Belle, Columbia and Martinez mines, 18 miles northwest of Florence, are reported sold to a Santa Barbara, Cal., company for \$40,000.

YAVAPAI COUNTY.

The White Horse M. Co. is ready to begin on its group on Lynx creek, near Prescott.—At Huron, the Henrietta M. Co. is working eighteen men, and the mill is running steadily on ore from the Silver-ton.—At the McCabe, thirty men are working.—Operations at the Swindler, near Prescott, owned by G. W. Hull, are under way; Supt. J. W. Hubbard.

The tunnel on the Verde Chief, in Black canyon, near Jerome, now in 200 feet, will be run an additional 200 feet.—A new \$5000 hoist will go in on the Pride of Arizona, at Big Bug; an 80 H. P. boiler was recently put in.—A steam hoist and pumps are about placed at the Mammoth.—A new shaft-house is going in on the Kicker of the Amalgamated G. & C. Co.—The Farley-Kay properties are reported sold to St. Joseph, Mo., men, and 5000 feet of tunnel will be run.—New machinery, including a 55 H. P. gasoline engine, air compressor and drills, is going in on the Gunther group, near Gilbert; No. 1 shaft is down 300 feet, and drifting is in progress on the 200-foot level. A whim is put in on No. 2 shaft.—The Great Belcher, at Big Bug, now down 500 feet, will go to the 700-foot level.—The shaft on the Golden Fleece, on Lynx creek, now down 200 feet, will be sunk an additional 100 feet.—Aikenite, a sulphide of copper, lead and bismuth, was recently found near Prescott.

YUMA COUNTY.

C. Eichelberger is pushing work on his property near Tyson's Well, two shafts are down 200 feet and 90 feet respectively.—Seven tons of ore recently shipped from the Modesti, 2 miles from Kofa, returned \$108 per ton. Shaft is down 100 feet; vein at that depth runs 6 feet in width; Supt. J. Young.—The dredger of the Advance G. Dredging Co., at the Pot Holes, is running day and night; Supt. H. Linn.—During 1900 the output of the La Fortuna mines, 28 miles southwest of Yuma, owned by C. D. Lane, was \$1,368,000 gold.

CALIFORNIA.

BUTTE COUNTY.

The Bloomer M. Co. is pushing work on the Bloomer, at Berry creek; a 200-foot tunnel has opened up quartz ore.

CALAVERAS COUNTY.

The Bennet-Sickle, at Angels, is reported sold to the Utica M. Co. for \$15,000; same company has bought the Dead Horse (quartz) mine and millsite.—On account of a scarcity of wood, the Ghost is

closed down; the Lightner chlorination plant is also closed down for some reason.

A new jacket pump is going in at the Gold Hill; 163 feet of water in shaft.—The Anglo Saxon G. M. & T. Co., of Boston, Mass., is opening up the old Ilex property, at Mokelumne Hill; Supt. J. O. Stewart.—A contract is let by the Glencoe M. & M. Co. to run a 100-foot tunnel on the Rockingham, near Glencoe; it will tap main shaft, now down 170 feet, at a depth of 120 feet.—New machinery will go in at the Lockwood, near Mokelumne Hill; operations at the mine are closed; owing to bad roads mill is being removed to site nearer mine.—The Machu and Smuggler mines, at Mokelumne Hill, are bonded to J. E. Spencer.—Rich ore is opened up on 200-foot level of the Lone Star.

EL DORADO COUNTY.

Unwatering the Church, at Placerville, is progressing.

INYO COUNTY.

More men are being put on at the Defiance, at Darwin.—Ore assaying \$400 to the ton is reported in a 2-foot ledge in Yuba canyon, near Independence.

J. King, owning and operating the Bronco mine at Ballarat, will put in a mill in October.—A ledge of \$35 ore is reported in the O Be Joyful, in Tuba canyon, near Ballarat. A one-third interest in the group is reported sold to W. S. James of Los Angeles for \$16,000—\$8000 cash and the balance in ninety days.

LOS ANGELES COUNTY.

At Newhall the Santa Ana Oil Co. recently struck oil sand at a depth of 850 feet. The well is said to be producing 200 barrels of oil per day.—The Zenith Oil Co.'s well, down 800 feet, is expected to strike oil at 900 feet.—The Alpine Oil Co. is drilling its No. 3 well. No. 2 is producing steadily.—The Sunset Park Oil Co. has struck oil sand at a depth of 520 feet on its property on Sixth street, Sunset Park, Los Angeles.

MARIPOSA COUNTY.

Ten stamps are dropping at the Francis, near Indian Gulch; mill is run by water power obtained from Mariposa creek.—The Mariposa Co. has closed down the Pine Tree mine, near Bear valley, and the Josephine.

MONO COUNTY.

Work is in progress on the old Harrison Berry, east of Topaz; A. M. Livingston of Oakland, owner.—Carney & Frost are operating the Pin Hook, near Antelope.—Good float rock is reported found on the Lake, same locality.

NEVADA COUNTY.

Operations are resumed at the Midnight, on Deer creek, near Nevada City. The shaft at the Diamond, Grass Valley, is down 180 feet; a new ore chute is opened up on the 150-foot level; sinking will be resumed.

ORANGE COUNTY.

The well of the Rincon Crude Oil Co., in the Fullerton district, is down over 1000 feet; drilling is in progress.

PLACER COUNTY.

The Eureka Con. M. Co. at Forest Hill has struck the blue gravel in the face of the drift at a vertical depth of 750 feet, and 4230 feet from the mouth of the tunnel, thus verifying and vindicating the effort and judgment of the superintendent in pushing the drift for the last four years. To drift mining in that vicinity the striking of the blue gravel means much, maybe another Mayflower.

SACRAMENTO COUNTY.

The Blue Ravine M. Co. has a machine for grinding black sand and sulphurets collected from sluice boxes in place. Here-tofore sand and sulphurets have been shipped away for treatment.

SAN BERNARDINO COUNTY.

At Gold Mountain the 40-stamp mill, owned by J. R. DeLamar, is running steadily; sixty additional stamps will probably be added this year; seventy-five men are employed.

D. E. Hayes of San Francisco will buy 380 acres of mineral land north of Ontario for \$50,000. The contract calls for the expenditure of \$2000 during the first three months and of \$5000 for each of the three remaining quarters of the year.

SAN DIEGO COUNTY.

Ore from the Iron Mountain, near Warner's Springs, recently crushed at the Ready Relief mill at Banner, ran \$40 to the ton.

The Golden Cross, near Ogilby, owned by the Free G. M. & M. Co., comprises thirty-two acres; surface shafts are down from 700 to 1000 feet; two mills on the property have a total of 140 stamps; the 300-ton cyanide plant is said to treat tailings at a cost of 70 cents per ton; ore runs from \$4 to \$10 per ton.—The shaft on the American Girl, near the Golden Cross, is down 450 feet; ore runs about \$12.50 to the ton; crushers are going in;

latter will treat ores from the American Girl and from the American Boy, adjoining; ore from latter mine runs about \$15 to the ton; American Boy shaft is down 350 feet.

SHASTA COUNTY.

Work on the Bunker Hill, near Redding, will be resumed shortly.

A half interest in the Alice and other claims in Sunny Hill district is sold to T. A. & H. T. Finnell for \$1500.

An air compressor will go in at the Shasta King, near Kennet; general manager, L. Auerbach.

Sinking and drifting are in progress on the Hart, in Old Diggings district, near Shasta. Thirty men are employed. The shaft is down 1100 feet. The ore is said to run from \$10 to \$500 to the ton.—Work is progressing satisfactorily on the Wiser, Sally Ann and others at Lower Springs.

It is thought that as soon as litigation over the Mt. Shasta is settled a mill will go in.—A company is incorporated to work the cinnabar mines on Clover creek.—A tunnel is being run on the Baker's at Old Diggings to tap the ledge at a depth of 300 feet.—Sinking is in progress on the Evening Star.

The Atlantic Oil Co. of Shasta county, capital \$500,000, is organized at Redding to work 1920 acres of oil lands near Millville.

The Clover Creek Cinnabar M. Co. has incorporated at Redding, with 300,000 shares at \$1 per share. The property is on Clover creek, east of Millville.—The Trinity Copper Co. has surveyors in the field, with headquarters at Kennet.

SIERRA COUNTY.

Supt. L. Cortez of the Sailor Boy, at Brandy City, is pushing work.

SISKIYOU COUNTY.

At Sawyer's Bar, Kleaver & Co. will start their mill.—Operations at the mine and mill of the Yreka M. & M. Co., at Sawyer's Bar, are progressing.

Supt. Fitch has extended the flume of the Salmon River M. Co. to a point one-half mile below Sawyer's Bar; work on the Myers (drift) is in progress.

SONOMA COUNTY.

A company is organized at Petaluma to bore for oil near there.

TRINITY COUNTY.

The Parker Bar Placer M. Co., operating at Lowden Ranch, has about 1000 acres of ground.—The Galvin Dredging Co., operating near Weaverville, has 321 acres of ground.

COLORADO.

ARCHULETA COUNTY.

The Omaha M. Co. will begin work on its group of claims near Pagosa Springs early in the spring; a 3000-foot tunnel will be run, which will gain a depth of about 2700 feet.

BOULDER COUNTY.

An 8-foot vein of ore is reported opened up on the 200-foot level of the Fourth of July, at Eldora.—Drifting is in progress on the Golden Eagle, at Ward.

CHAFFEE COUNTY.

A car of ore recently shipped from the Belle of Granite, at Granite, yielded \$3500.

CLEAR CREEK COUNTY.

Operations are resumed on the Josephine, at the foot of Kelso mountain, near Georgetown.

The Silver Age group, near Idaho Springs, is reported sold to the Colorado-California S. M. & M. Co.; a new shaft will be sunk; ore runs from \$40 to \$50 to the ton.

DOLORES COUNTY.

At Denton, connection is made between No. 4 level of the Emma and the crosscut on the Scott.

GUNNISON COUNTY.

At Gold Brick, the tunnel on the New Bassick & Belzora Nos. 1 and 2 (consolidated), on Sacramento mountain, is in 70 feet; shaft is down 40 feet.—The Brunswick M. & M. Co. is driving a new tunnel on the Jimmy Mack group of seven claims on West Gold hill.

LAKE COUNTY.

The shaft on the Coronado, at Leadville, is down 660 feet; new ore bodies opened up at that depth have added 100 tons of ore per day to shipments of the district; Manager Higgins.—During December, 1900, 1200 tons of ore were taken out of the Maid of Erin (silver), at Leadville, owned by the A. M. W. Co.—The Fryer Hill G. M. Co., operating the Double Decker and Fairplay claims, on Yankee hill, Leadville, expects to cut the old producing ore shoot soon, drift now being in 40 feet.—A pump is put in on the first level at the Valentine, and 300 gallons of water per minute are being handled; Manager C. Bohn.

OURAY COUNTY.

A new 1200-foot tramway is to go in at the Bachelor, at Ouray. Ore carrying 300 ounces silver, with

copper and gold, is reported at the Governor, at Ouray.

PARK COUNTY.

A strike of copper and gold ore is reported made near Midland Station; shaft is down 100 feet, opening up a 4-foot ledge of ore running \$180 in gold, copper and silver to the ton; it is thought that regular shipments of ore will be begun soon.—The Boomer, same locality, is shipping regularly.

SAGUACHE COUNTY.

At Crestone, a new shaft will be sunk on the Cleveland.

J. R. Robinson and other Colorado Springs men have bought a group of claims at Bonanza, ore from which is said to run \$40 to the ton.

SAN JUAN COUNTY.

The auxiliary steam power plant at the Kendrick-Gelder smelter at Silverton is in place.

The Red Mountain M. Co. will soon begin work on the Lead Carbonate group, above Gladstone; about 400 feet of work is completed on the property and ore is said to run \$12 gold to the ton; a crosscut tunnel will be run to cut the veins at a depth of from 600 to 1000 feet.

SAN MIGUEL COUNTY.

The Alta M. Co. contemplates putting in a mill on the Alta, near Telluride, this season; ore reserves in this mine are estimated at \$600,000.

During January 157 carloads of ore were shipped from Telluride.—The tunnel on the St. Julien, which crosses the Palmyra, is in 1000 feet.—The Rose group, consisting of five claims on Last Dollar mountain, near Telluride, is reported sold to G. B. Cook of St. Louis and F. Howard of Kansas City; a mill will be put in.

The Lake View group, in Ophir district, has about 1800 feet of tunnels, etc.; it is said that cost of extraction does not exceed 25 cents per ton; lowest levels are 4000 feet below the apex of Yellow mountain.

SUMMIT COUNTY.

At Kokomo, work is resumed on the Michigan.—The Col. Sellers is shipping ore.—A long tunnel will be driven into Gold hill by the Union Con. Co.—At Frisco, operations are under way in four levels of the Excelsior.

TELLURIDE COUNTY.

Supt. Trevanthen furnishes the following figures showing the production of the Portland mine for the year 1900:

	Totals	Net tons	Uncoined silver, ounces	Gross value	Treatment charges	Freight charges	Net proceeds
January	60,786.755	3,811.668	9,102.539	\$178,329.25	\$28,052.32	\$1,846.37	\$140,640.57
February		3,678.836	11,400.887	223,844.30	28,400.60	1,836.67	183,597.03
March		4,380.408	10,446.559	205,680.80	33,519.72	13,088.65	159,072.43
April		1,934.808	3,191.342	63,734.61	14,530.35	4,822.08	44,382.18
May		4,210.406	7,866.660	157,123.66	30,127.61	11,529.96	115,475.64
June		5,864.571	9,884.380	197,726.66	41,273.67	14,800.99	141,652.03
July		6,296.323	9,023.754	180,631.07	35,883.86	12,768.27	132,079.27
August		5,760.611	9,247.669	204,388.07	33,944.49	15,163.04	145,280.54
September		6,326.870	10,216.894	209,128.91	41,243.43	14,762.14	129,123.24
October		5,987.584	11,498.664	186,128.91	44,853.22	15,094.08	116,653.63
November		6,583.898	12,002.818	241,665.95	48,397.42	16,510.10	176,657.13
December		7,138.732	14,140.667	282,616.44	50,812.38	19,054.64	212,749.42
				\$841,039.26	\$150,098.94	\$1,751,231.16	

During the four months ending Jan. 15 last the thirteen leasers on the Anaconda at Cripple Creek have produced 2551.313 tons of ore, valued at \$62,578.54, upon which a royalty of \$7931.32 was paid.—

The Pythias G. M. Co. will sink a working shaft 500 feet on the Last Chance, on Bull hill, Cripple Creek. A plant capable of sinking 500 feet will be put in; F. Smith Supt.—Ore running 30% lead, \$50 in silver and eight ounces gold per ton is reported from the Highland Chief, on Galena hill, Cripple Creek.—Giles and associates have finished putting in a new steam plant on the north block of the Sedan. Drifting and crosscutting will be done on the 100-foot level.—Sinking is in progress on the Kellum lease, on the Sedan.—An extra shift is put on at the Ophelia tunnel. Two machine drills are used.—The Camilla Leasing Co., operating the Maud Helena, will put an extra shift on sinking the shaft, now down 180 feet.—The Eagle sampler at Cripple Creek is treating 200 tons of ore daily.—The Pittsburg Bankers' Leasing Co. will resume on the Morning Star. It is said that \$70,000 has been spent in development on this lease.—A body of good ore is reported opened up in the winze on the Alsa R., Cripple Creek.—The Theresa M. & L. Co., operating a block on the Theresa, on Bull hill, is running its sixth level.—The shaft on the Extra is down 150 feet and the ore runs \$35 per ton.—On the Santa Rita the shaft is down 600 feet.—The shaft on the Wild Horse, now down 500 feet, will be sunk to the 800-foot level. At that depth connection will be made with the Columbine-Victor tunnel, which is expected to be finished by June.—The Elkton at Cripple Creek is said to produce \$125,000 per month.—Berg & Co., operating on block 2 of the Deadwood at Victor, have sunk a 500-foot winze from the 552-foot level. The ore at this depth runs from \$16 to \$60 to the ton. The shaft is down 652 feet. A 100-foot crosscut will be run on this level.—On the 220-foot level of the Rigi at Victor a 70-foot west drift and a 30-foot east drift are run.

The Metallic tunnel, now being driven through Rhyolite hill, Cripple Creek, will also pass through a portion of Copper mountain, Carbonate, Tenderfoot and Globe hills, and into Gold hill, cutting them at depths of from 1000 to 1500 feet.

IDAHO.

ADA COUNTY.

The Buffalo Hump G. M. Co., capital \$1,000,000, is incorporated at Boise City. The Thunder Mountain Copper Co., capital \$120,000, is incorporated at Boise.

BLAINE COUNTY.

The mill at the Star, near Hailey, will start up soon. The ore opened up in the 172-foot crosscut on the 300-foot level runs from 6% to 20% copper, from ten to forty ounces silver and from \$10 to \$150 gold to the ton; H. H. Hollister owner.—Ore running from 6% to 30% copper and \$60 gold to the ton is opened up in the 500-foot level of the Tip Top; Supt. Lusk.—A new 20-stamp mill will go in for the Hattie at Hailey this year; J. Black owner; 1050-pound stamps will be used in the mill.—A heavier compressor is going in at the Croesus, to enable sinking to be continued.—Messrs. McClure of St. Louis, Mo., will sink a 1000-foot shaft on the Black Cinder group; Supt. J. Doniphan.—A 10-stamp mill will go in on the Jumbo, near Hailey.—A 1200-foot tunnel is being run on the Red Elephant, near Hailey, owned by A. Brown of Salt Lake, Utah.

CUSTER COUNTY.

The Yankee Fork, on Estes mountain, near Custer, is sold to Boston men for \$100,000.

The Lucky Boy, near Custer, has forty men working; a cyanide annex is in at the mill, and it is said to save 98% of the value. The cost of milling is given as \$2.50 per ton.—Ore from the vein on the Admiral Dewey assays from \$4.40 to \$262 per ton.

LEMI COUNTY.

A ledge of rich ore is struck on the A. D. & M., at Gibbonsville; more men will probably be put on.—Operations on the Clara Morris and Hughes & Hunt mines, near Gibbonsville, are resumed; ten men are working.

OWYHEE COUNTY.

The buildings at the Blaine tunnel, near Silver City, were recently destroyed by fire, and will be rebuilt.

SHOSHONE COUNTY.

A carload (26,082 pounds) of ore recently shipped from the Snowstorm, near Mullan, netted \$27.25—an average of \$21.26 per ton.—McIntosh, Crawford & Hyde of Kellogg, operating the Sherman group, on Elk creek, near there, will erect a concentrating plant there this spring; they have bought the timber and machinery of the old Elk creek mill and will use the same in the new plant.—The Idaho-Montana Summit M. Co., Ltd., capital \$100,000, is incorporated at Murray.

Two feet of high-grade ore are opened up at the 100-foot mark in the upper tunnel of the Humming Bird at Burke. The lower tunnel is in 120 feet.—An air

shaft from the tunnel level to the surface is just completed at the May, on Pine creek, near Wardner; Supt. T. Brown.—Sixty men will be put on at the Hunter at Mullan. Operations will be resumed.—The new ore bins at the Mammoth, near Wallace, will probably be completed within a month. The building is 30x60 feet and the bins are calculated to hold thirty carloads, or about 1500 tons, each.

MONTANA.

BEAVERHEAD COUNTY.

A new lease is secured on the Polaris, near Dillon, by J. E. Rickards and others of Dillon, for \$25,000; ore is being shipped from the property.

LEWIS AND CLARKE COUNTY.

The furnace capacity at the East Helena smelter is now 1000 tons per day; apparatus going in to catch blue dust.

MADISON COUNTY.

Work at the Red Cliff, near Red Bluff, is suspended until the concentrator is in operation.—The new battery of boilers is in at the Red Bluff and pumping is now in progress; machine drills will be used at the mine when latter is unwatered, and more men will be put on; Manager Turner.—The Centennial-Toledo G. S. L. & C. M., M. & S. Co. will sink 100 feet on the Toledo, near Sheridan.

Work is under way on the Emma B., on Mill creek, near Sheridan; a cyanide plant is on the property.—The new 20-stamp mill on the Lake Shore, same locality, will operate this spring; twenty men are working.—The Montana, near the Lake Shore, is closed down for the winter.—The Klondyke, at Sheridan, is leased to W. B. Holmes of that place.

SILVER BOW COUNTY.

At Butte the new compressor and drills are in at the Lake Shore, and progress is being made in driving the tunnel.—The Milwaukee & Montana M. Co., operating the Chile, will put in a concentrating plant this spring.—Shipments of ore from the Elkhorn Queen average about 500 tons per month.

NEVADA.

ELKO COUNTY.

At the Copper Mountain group, near Tecoma, it is estimated that there are over 100,000 tons of high-grade copper ore blocked out; property is owned by Lewisohn Bros of New York; D. Kane, Supt.

Mr. Bacon has ten men working his coal property southeast of Elko.

LYON COUNTY.

The Boston-Montana Copper Co. of Butte, Mont., will put in a 150-ton smelter at Wabaska during the year.

STOREY COUNTY.

The 10-stamp mill of the Comstock Tunnel Co., at Sutro, has begun crushing rock from the waste dumps at the mouth of the Sutro Tunnel.

Transformers are going in on the 1750-foot level of the Con. California & Virginia, at Virginia; during week ending Feb. 9th six cars of ore (340,450 pounds R. R. weight) were shipped to the Selby Smelting & Lead Works, San Francisco, Cal.; average assay value of ore shipped was \$54.74.—The west drift in the Ophir is in 226 feet; 125,100 pounds of ore and one bar of bullion of par value of \$1764.22, the result of a mill test of 100 tons of second class ore at the Douglass mill, were shipped to the Selby Smelting & Lead Works, San Francisco, during the week ending Feb. 9th; the west drift on the 56-foot level is in 307 feet.—On the Central tunnel level of the Mexican the west crosscut is run 296 feet; face in hard porphyry.—The tunnel on the Hale & Norcross is in 2017 feet.—On the 220-foot level of the Sierra Nevada the south drift from the northwest drift, 387 feet from shaft, is in 144 feet; west drift on the 1600-foot level is cleaned out and repaired for a distance of 990 feet from shaft.—At the Chollar, No. 1 east crosscut on surface tunnel level, started 455 feet north of the tunnel, is out 35 feet; face composed of clay and porphyry.—On surface tunnel level of the Potosi the south drift from the main tunnel, 40 feet east from end of drift and 972 feet in from its mouth, is run 323 feet.—At the Silver Hill the southwest drift is in 190 feet; raise started in the Holman tunnel, 110 feet above track floor, is run 33 feet.—At the Gould & Curry stoping is in progress on the first, second, third, fourth and fifth floors of the 325-foot level; during week ending Feb. 9th 214 tons of ore were milled; which returned \$11.23 coin per ton, as per battery samples.—The west drift on the 425-foot level of Best & Belcher is in 73 feet.—Surface tunnel No. 2 in the Utah is in 863 feet; face in hard porphyry.—At the Belcher repairs are being made to the main lateral drift on the 1100-foot level.—A crosscut is being run on the 1100-foot level of the Crown Point.

WHITE PINE COUNTY.

The new \$35,000 cyanide plant of the Ely M. Co., at Ely, is running.

A new body of high-grade ore is uncovered at the Rocco-Homestake, at Hamilton; Supt. H. A. Jackson; vein is 1 foot in width.

NEW MEXICO.

DONA ANA COUNTY.

A strike of rich ore is reported on the 200-foot level of the Torpedo, at Organ.

GRANT COUNTY.

A strike of sulphides was made recently on property of the Clifton Copper Co. near Earnst; \$30,000 worth of the ore is estimated in sight.

At Pinos Altos the concentrator is completed.—Work is resumed on the Texas, at Central.

LINCOLN COUNTY.

The new dredger of the American Placer Co., at Jicarilla, is completed and will start this month.

SANTA FE COUNTY.

The Golden Eagle, at Cerillos, is sold to the smelter at that point.

SIERRA COUNTY.

A one-half interest in the Ashville, near Grafton, is sold to A. Walker for \$15,000—\$1500 cash, balance in ninety days.

At Chloride drifting is in progress on the May; ore carries copper and silver.

SOCORRO COUNTY.

It is feared that the recent order of the Secretary of the Interior regarding the Gila Forest Reserve may result in closing down several mines in the Cooney district, among them being the Cooney (copper), the Maud S., the Helen group, the Last Chance and others. The Cooney is operated by H. C. McCreery of Colorado Springs, Colo.; a concentrating plant is on the property and regular shipments of ore are made to the Silver City, Colo., smelter.—The Maud S. is credited with a production of 65,000 tons of ore, valued at \$850,000; 11,000 tons of ore are estimated in sight; a good plant is on the property.—The shaft on the Last Chance, operated by the Last Chance M. Co. of London, England, is down 600 feet; a 20-stamp mill is in operation.

A body of gold-copper ore is opened up at a depth of 350 feet in the Hardscrabble, at Magdalena; find is said to be from 30 to 40 feet wide.

TAOS COUNTY.

Work is under way on the Sedgwick, at Amizett.—Machinery for the 25-ton stamp mill for the Black Copper is on the ground and construction work will be pushed.

OREGON.

BAKER COUNTY.

The new 10-stamp mill at the Gold Mill, 20 miles south of Baker City, is in operation; it is probable it will be enlarged this spring or summer; J. A. Panting, manager.

The Golconda, in Cracker Creek district, near Baker City, is reported sold for \$600,000; a 20-stamp mill and a hoisting plant are on the property.—The shaft on the Gold Hill, at Express, is down 850 feet.—Ore from the Justice, at Sumpter, operated by the Justice G. M. Co., runs from \$18 to \$63 to the ton; the ledge is 12 feet wide.—Good progress is being made in running the tunnel on the Tammany, near Sumpter.

JOSEPHINE COUNTY.

The Sugar Pine, in Galice Creek district, near Galice, is reported bonded to H. W. Kerchoff and E. W. Rattler.

TEXAS.

BURNET COUNTY.

The White Eagle M. Co., recently incorporated, will put in a mill on the White Eagle (copper), near Burnet; ore carries gold.

UTAH.

BEAVER COUNTY.

Ore running 24% copper to the ton is being taken out at the Ben Harrison, at Milford; shaft is down 60 feet and a drift is run at that depth.—D. W. Dederichs, Supt. Talisman group, in Star district, 5 miles from Milford, reports good progress on that property.

BOX ELDER COUNTY.

The Century, in Park valley, 25 miles northwest of Kelton, is turning out ore running \$25 to the ton; a 50-ton per day mill, costing \$10,000, will go in this spring.

JUAB COUNTY.

At Tintic the King William is sold to the Grand Central for \$180,000.—The Mammoth No. 2, a fractional claim 200x400 feet, lying between the Mammoth and the Ajax mines, is reported sold to S. McIntyre, W. McIntyre and E. Richards for \$25,000.—The same ore chute that was recently opened up on the 1800-foot level of the Mammoth is reported opened up in the 100-foot drift on the 1900-foot level.—A car of ore from the Lower Mam-

moth at Tintic, recently shipped, netted \$3100.—The Elma M. Co. will begin work on the Elma, at Tintic.

The new ore body recently opened up on the 600-foot level of the May Day, at Tintic, continues to be of same grade, ore yielding eighty ounces silver to the ton.—A concentrator, with a capacity of from 125 to 150 tons per day, and to cost \$20,000, will go in at the Tesora, at Tintic, this spring; Manager, O. P. Posey.—An assessment of 1 cent per share is levied by the Little Chief M. Co. of Eureka, delinquent March 15th.

During January thirty-five cars of copper and gold ore were shipped from the Carlissa, at Tintic.

PIUTE COUNTY.

A strike of \$30 ore is reported made in the 225-foot tunnel of the Wheeler group, at Fish creek; the vein is 16 feet wide; owner, G. W. Wheeler of Minneapolis, Minn.

SALT LAKE COUNTY.

The new eight-drill compressor, recently put in at the Bingham C. & G. M. Co.'s mines, at Bingham, was shut down lately, owing to failure of Jordan Narrows electric power; old steam power compressor was substituted.—The Provo Electric Co. expects to supply Bingham with electric light and power.

On the 7th inst. the Highland Boy, at Bingham, shipped 60,098 pounds of pig copper to the Eastern refinery.

SAN JUAN COUNTY.

The Gommer M. & M. Co., Supt. S. A. McLean, has a 5-stamp mill running near La Sal.—A railroad will probably be built from Grand river to La Sal this summer.

The San Juan Oil Co., capital \$100,000, is incorporated to work 160 acres of oil land 40 miles west of Bluff.

SUMMIT COUNTY.

More machinery has arrived for the new Silver King sampler, at Park City; construction work is progressing; plant will be lighted by electricity.—S. Spiro, who bought the Little Bell group, near Park City, will begin work.—Wages have been raised by the Quincy M. Co.; hereafter muckers will receive \$2.75, stopers \$3, and machine men \$3.25 per day.

TOOELE COUNTY.

The Cyclone and Tiptop claims, at Stockton, are bonded to C. M. Pratt of Salt Lake; the properties will be examined, and, if report is favorable, work will begin.

The new machinery on the Stockton, at Stockton, consisting of air compressor, drills, hoist and an engine, is running, and sinking of main shaft will be continued to water level, when concentrators will be put in.

WASHINGTON COUNTY.

The property of the Dixie M. Co., consisting of 200 acres of copper-bearing ground and the 30-ton per day smelter, at St. George, is reported sold to the Bingham & Eastern Copper Co. of New Haven, Conn., for \$200,000—\$25,000 cash and balance to be paid within four months; a depth of 600 feet is attained on the property; during last December \$35,000 worth of copper was turned out by the smelter.

VERMONT.

ORANGE COUNTY.

The oldest copper mine in America is said to be the Ely-Copperfield, at Copperfield, recently sold to Pittsburg, Pa., men; a railroad will probably be built this spring from the Ely mines to White River Junction, at which point it is proposed to put up large reduction and smelting works. The mine has been in operation since 1820. The main working shaft is down nearly 5000 feet on the incline. The estimated production for 1901 is given as between 7,000,000 and 10,000,000 pounds of refined copper.

WASHINGTON.

FERRY COUNTY.

Another stratum of ore, 5 feet wide, is opened up in the Wauconda tunnel at Republic. Two samples of ore gave, respectively, \$11.40 and \$13.60 to the ton. It is probable that a 100-ton plant will be put in this year.—Ore from the 60-foot level of the Nancy, 4 miles from Nelson, recently ran \$405.39 to the ton.

Ore recently shipped from the Quilp, at Republic, to the Granby smelter, at Grand Forks, B. C., returned \$35 to the ton; twenty tons of ore per week are now being shipped to Grand Forks, B. C.

LINCOLN COUNTY.

The Elephant, in Cedar canyon, near Davenport, owned by the Cedar Canyon M. Co., is making regular shipments of ore.

OKANOGAN COUNTY.

The vein on the Q. S., near Loomis, shows a width of 4 feet of copper-gold ore, assaying \$30 to the ton.—A 500-foot double compartment shaft will be sunk on

the Buckeye, of the Wehe Con. M. Co. Crosscutting will be done at that depth. Should developments prove satisfactory, a mill is projected.

SNOHOMISH COUNTY.

The North Star M. Co. is running a tunnel on the North Star group, 1½ miles from Index; S. A. D. Davis, manager.—Work is being pushed on the Bunker Hill-Sullivan group, near the North Star group.—Ore recently shipped from the Sunset to the Everett smelter yielded 23.8% copper.—A smelter may be built at Darrington by Colorado men.

WYOMING.

ALBANY COUNTY.

The Rambler (copper), on Douglas creek, 35 miles southwest of Laramie, is shipping three carloads of ore weekly to the Argo smelters at Denver, Colo.; the ore is a copper glance, running 27% copper, 60 cents gold and six ounces silver to the ton. Forty-five men are employed. A sulphuric acid leaching plant will probably go in this spring to treat the low-grade ore; Supt., C. Kuster.—Ore from the Baker-Swigart (copper), 35 miles northeast of Laramie, runs 35% copper to the ton.

CARBON COUNTY.

A strike of copper ore is reported made on property near the Kurtz-Chatterton, Grand Encampment.

FOREIGN.

BRITISH COLUMBIA.

Supt. Biesel of the St. Eugene at Moyie states that his company has contracted to ship ore to Antwerp, Belgium.—On the Paradise group, Windermere, twenty-two men are working.—The tunnel on the Lead Queen, on the north fork of No. 3 creek, Windermere, is in 165 feet.—The Canadian Pacific R. Co. has made a new tariff rate on matte and bullion from all Kootenay points to New York and Newark, N. J., of \$16 per ton, a cut of \$2 per ton on the former rate.—Drifting is progressing on the Phoenix at Slocan. The ore at present runs about \$100 to the ton.—The Black Prince and the Darius, Dundas No. 2, Summerside, Black Prince Fraction and Four Friends claims are reported sold to the Canadian Goldfields Syndicate for \$75,000, the Black Prince bringing \$50,000.—Work on the Iron Horse at Slocan is resumed. The winze will be sunk to a depth of 100 feet, and ore will be sacked for shipment as sinking progresses. A 200-foot crosscut will be run at the 100-foot level. A hoist will go in immediately, and should developments prove satisfactory a mill will be erected.

MEXICO.

The Dewey, at Willard, Sonora, is shipping high-grade ore.—At the Escudra, 9 miles from Ocotlan, Sonora, 400 men are employed; shaft is 480 feet deep; ledge at that depth is 4½ feet wide; during 1900 ore shipments amounted to \$508,000 (Mexican), and cost of production, transportation, etc., was \$72,400, leaving a net return of \$435,600; ore is shipped to Seckback & Co. at Oaxaca; primitive methods of mining are in vogue at the mine; Kislinsbury & Hamilton have the property under bond and may sell it to New York parties.—The Mexican Petroleum Co. is incorporated, to develop 400,000 acres supposed oil lands near Tampico.

QUEBEC.

The daily output of the blast furnace of the Canada Iron Furnace Co.'s plant at Radnor Forges is thirty-five tons of pig iron.—At Thetford the Beaver Asbestos Co. is putting in a new asbestos plant.—The Johnson's Co. is putting in new asbestos mills at Black Lake and Thetford.—In Black Lake district Dr. Reed will probably put in a mill on his property.—The new \$250,000 plant of the Pittsburgh Reduction Co. at Shawinigan Falls is completed. It will reduce aluminum from Canadian corundum ores.

SOUTH AMERICA.

The Playa El Oro M. Co. of Ecuador, owned in London and New York, is extending its ditch and pipe lines. Each monitor has a head of 240 feet and uses about 250 miners' inches; the pipe is all 22-inch. A four months' supply is assured. A third pipe line will be finished March 1. Ecuador, S. A., Jan. 3, 1901.

THE KLONDIKE.

All claims still held by the Crown, including fractional claims, except those in litigation and those reserved for compensation, will be thrown open for location on the 27th inst., and it is reported that thereafter no more Crown reservations of mining claims in the Klondike or Northwest Territory will be made.

Considerable work is being done on Eureka creek, 40 miles from Dawson, this winter.—A private estimate gives the coming clean-up of the mines in the Klondike at from \$12,000,000 to \$15,000,000.

Personal.

W. B. HOLMES of Sheridan, Mont., is in England.

W. S. HASKIN is now Supt. Iron Mountain, Keswick, Cal.

SUPT. DOBLER of Shasta county, Cal., is in San Francisco.

W. E. HAMPTON of the Pacific Tank Co. goes to Honolulu.

J. A. CHESTNUT, formerly of Downieville, Cal., goes to Mexico.

J. W. NEILL has returned to Salt Lake, Utah, from a two months' trip.

PHILIP ARGALL, of Denver, Colo., will spend next summer in Europe.

T. A. RICKARD, State Geologist of Colorado, is visiting San Francisco.

P. A. H. FRANKLIN, of Salt Lake, Utah, is in Salmon City, Idaho.

C. D. ROOKLIDGE of Darwin, Cal., has returned there from San Francisco.

J. F. LANG, formerly of Shasta and El Dorado counties, Cal., is in Chicago, Ill.

A. S. COOPER'S official term as California State Mineralogist expires March 31.

D. KANE, Supt. Copper Mountain M. Co., Tecoma, Nev., goes to Denver, Colo.

MAJOR BOHN has resigned the management of the Home M. Co., Leadville, Colo.

EDGAR RICKARD returned to California on the last Australian steamer from Tasmania.

H. W. WHIRLOW, Supt. Angels (quartz), Angels, Cal., has resigned; T. Fullen succeeds him.

MR. HASSLACHER of the Roessler-Hasslacher Co. of New York City is in San Francisco.

THOS. RAPSON succeeds Thos. Carlyon as mining captain at the Trimountain mine, Houghton, Mich.

J. W. SHARPE, manager Mulatos M. Co., Mulatos, Sonora, Mexico, has returned there from California.

R. D. HUNTER, manager Denver branch of the Sullivan Machinery Co., has returned to Denver from Chicago.

J. B. MYERS, electrician at the Ontario drain tunnel, Park City, Utah, has resigned; C. B. Blanchard succeeds him.

ROBERT CURR is in San Francisco to direct some of the work relative to the Risdon Iron Works' new ship-building plant.

F. W. EDELSTEN, formerly publisher and proprietor Mining & Metallurgical Co., is in Arizona in the interests of the Colonial Copper Co., of New York.

WM. T. ST. AUBURN, formerly Supt. Niagara mine, French Gulch, Cal., more recently in charge of Rhodesia, S. A., mining interests, has returned to Shasta Co., Cal.

HUDSON H. NICHOLSON, consulting engineer for the American Mining Investment Co. of Denver, Colo., is giving a course of lectures at the University of Nebraska at Lincoln, Neb.

JESSE J. MACDONALD, formerly in charge of the coast interests of the Gold & Silver Extraction Co. of America, Ltd., is consulting metallurgical engineer for El Almacen de las Minas, City of Mexico.

Trade Treatises.

Ore Crushing Machinery, fourth edition; illustrated description and discussion of ore-crushing appliances, with special reference to operation of modern ore-crushing plants; The Colorado Iron Works Co., Denver, Colo.

No. 17 of the series, 1901 edition, treating of gold dredging, with details of cost of operation of successful work; The Risdon Iron Works, San Francisco, Cal.

The Parker Steam Generator, alleging advance in steam boiler practice that includes unusual economic conditions; The Parker Engine Co., San Francisco and Philadelphia.

The Canadian Rand Drill Co., mostly a description of their new shops at Sherbrooke, Ontario.

Fraser & Chalmers, Chicago and London, sixth edition of their treatise on engines and boilers, with new illustrations and specifications of steam power plant accessories.

The Geo. E. Dow Pumping Engine Co., San Francisco, illustrating and describing steam pumps, electric pumps and hydraulic machinery in general, with full detailed specifications, as to efficiency and adaptability in individual cases.

Chicago Pneumatic Tool Co., Chicago, in English, German and French, showing different tools pneumatically operated.

Arthur Koppel, 66 Broad St., New York City, profusely illustrated description in English and Spanish of all manner of material required for narrow-gauge railways, with views of mines in all parts of the

world which are equipped with rails, tracks, switches and cars of his make.

Trade treatises noted herein will be sent upon request by the firms issuing them except otherwise stated.

Commercial Paragraphs.

JAS. S. BROWNELL, Western agent Frue Vanning Machine Co., 132 Market St., San Francisco, Cal., reports the following sales for the past four months: Keystone Con. M. Co., Amador City, Cal., fourteen 4-foot Frue vanners; Victor Gold Mines, Brownsville, Cal., four 6-foot Frue vanners; Ribbon Rock Mines, Sonora, Cal., two 6-foot Frue vanners; App Con. M. & M. Co., Jamestown, Cal., twenty-four 6-foot Frue vanners; Gould & Curry mine, Virginia, Nev., nine 6-foot Frue vanners; the Empire Mines, Grass Valley, Cal., twelve 6-foot Frue vanners; Crystal Lake Mines, Lundy, Cal., two 6-foot Frue vanners; Wadsworth M. & M. Co., Wadsworth, Nev., one 6-foot Frue vanner; Black Oak Mine, Soulsbyville, Cal., four 4-foot Frue vanners. All of the above machines are supplied with the Brownell "patent lip" flange belts.

Recently Declared Mining Dividends.

	Payable.
Four Metals M. Co., Colo., \$25,000.	Feb. 20
New York & Honduras Rosario M. Co., Honduras, C. A., 20 cents per share (regular 10 cents and extra 10 cents), \$30,000.	Feb. 16
Mammoth M. Co., Utah, 5 cents per share, \$20,000.	Feb. 8
Plumbago M. Co., Cal., \$12,000.	Feb. 15

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING FEB. 5, 1901.

667,383.—WASHING MACHINE—R. S. Andrews, Redding, Cal.
 667,180.—WELL CASING—E. J. Bates, Bakersfield, Cal.
 667,645.—BAG HOLDER—A. S. Beck, Pasadena, Cal.
 667,181.—WATCH POCKET—Jennie Beebe, Los Angeles, Cal.
 667,186.—GAS CUT OFF—V. E. Campbell, Winnemucca, Nev.
 667,293.—FLY PAPER HOLDER—Cherry & Radke, S. F.
 667,294.—FLY TRAP—Cherry & Radke, S. F.
 667,303.—TRAP—G. R. Evans, Fresno, Cal.
 667,206.—BEER COOLER—T. R. Faughnan, Colusa, Cal.
 667,511.—ARTIFICIAL LIMB—I. R. & W. D. Fenner, S. F.
 667,514.—CONCENTRATOR—G. J. Frey, Oakland, Cal.
 667,214.—SOLDERING IRON HEATER—J. W. Gheen, Astoria, Or.
 667,397.—EDUCATIONAL APPLIANCE—F. D. Jones, Los Angeles, Cal.
 667,446.—REFRIGERATOR—R. A. Maddox, Phoenix, Ariz.
 667,555.—COATED SCREW—A. W. McGahan, Los Gatos, Cal.
 667,367.—PRODUCING COPPER—G. Mitchell, Jerome, Ariz.
 667,400.—VEHICLE WHEEL—A. S. Moore, Galt, Cal.
 667,572.—PIPE WRENCH—C. Peterson, Los Banos, Cal.
 667,578.—BILL HOLDER—M. C. Robichau, S. F.
 667,254.—BRIQUET MACHINE—R. Schorr, S. F.
 667,255.—PRODUCING CEMENT—Schubert & Pierce, Sacramento, Cal.
 667,352.—FLUSHING APPARATUS—F. Walker, Los Angeles, Cal.
 667,472.—FISH TRAP—Welch & Lamley, Astoria, Or.
 667,415.—STAMP DIE—Frank White, Nevada City, Cal.
 667,641.—HYDROCARBON BURNER—J. D. Williamson, S. F.
 667,279.—NAIL MACHINE—J. H. Yeakey, Redding, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ICELESS REFRIGERATOR.—No. 667,446. Feb. 6, 1901. R. A. Maddox, Phoenix, Ariz. This invention relates to an apparatus for refrigerating or cooling air within a cooling box or chamber. It consists of an inner and an outer case, one separated from the other, a fibrous covering material upon the inside frame, means for delivering water so as to flow over and

moisten the fibrous covering, from which a constant evaporation will take place, and the interior of the apparatus will be kept cool. The door has a similar inner wall covered with fibrous material and a drip trough, so suspended above it that when the door is opened this trough will catch the water from above and prevent it dripping across the door opening. When the door is closed, this trough is pushed out of the way so that the water can flow down and moisten the fibrous covering. Suitable ventilating openings are applied to the apparatus, so that a constant circulation of air may take place through the apparatus, and the temperature will be reduced to a very low degree by the operation.

Latest Market Reports.

SAN FRANCISCO, Feb. 14, 1901.

SILVER.—Per oz., Troy: London, 28d (standard ounce, 925 fine); New York, bar silver, 60½c (1000 fine); San Francisco, 60½c; Mexican dollars, 50c.

The troubles in China and India and the fact that the Bank of Shanghai is full of silver are given as among the reasons for the decline in price.

COPPER.—New York: Lake, 1 to 3 casks, \$17.00; carload lots, 16.75; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.35; Casting, 1 to 3 casks, 16.50; carload lots, 16.25. San Francisco: 18. Mill copper plates, 20c; bars, 22½c.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.20; Missouri lead, \$4.32½ desilverized lead; San Francisco \$5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6½, sheet 7½, bar 6c; pig, \$4.70 @5.10. London, £15 2s 6d per ton=3.27½ cts.

SPELTER.—New York, \$4.00; St. Louis, \$3.75; London, £17 7s 6d per ton=3.87½ cts. per lb; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13½c; 100-lb lots, 15½c.

IRON.—Pittsburg, Bessemer pig, \$13.50; gray forge, \$13.30; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$21.00; open hearth billets, \$21.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.45; San Francisco, ton lots, 29c; 1000 lbs., 29½c; 500 lbs., 29½c; less, 30c; bar tin, \$b, 35c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.50 ½ flask of 76½ lbs.; Export, \$44.

U. S. quicksilver exports for 1900 aggregated 778,191 pounds.

MAGNESIUM.—New York, \$2.90 ½ lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 15½c.

ASSAY LITHARGE.—San Francisco, 10c ½ lb, small lots.

BISMUTH.—New York, ½ lb., \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 lb lots.

PLATINUM.—San Francisco, crude, \$17 ½ oz.; New York, \$18.20 per Troy oz.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

PHOSPHORUS.—F. o. b. New York 50@60c ½ lb.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1½, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c ½ set; 14 oz., 40s., 10c.

DRY PLACER MACHINES.

THE PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or re-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quick-silver; no black sand remains with the gold. Will work equal to careful panning.

THE PNEUMATIC SEPARATOR.
Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries. SEND FOR DESCRIPTIVE CIRCULAR.

DENVER, COLO., U. S. A.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

WILL NAME PRICES F. O. B. DEADWOOD, CHICAGO, OR DELIVERED AS DESIRED.

SPECIFICATIONS (Condensed).

- 6 ORE GATES, 24 x 38, rack, hand wheel, frames, bolts, complete.
- 2 ORE BINS, all necessary bolts, rods, nuts and washers.
- 2 GRIZZLEYS, 4' x 10', 1" openings.
- 6 CHALLENGE AUTOMATIC ORE FEEDERS, including hoppers, wood frame, shafts and pulleys.
- 6 HUNTINGTON CENTRIFUGAL ROLLER MILLS, 5' diameter, all fixtures and fittings, complete with wooden frame, shafts, pulleys and gearing.
- 6 COPPER TABLES, 6' x 12', 1/2" copper, electroplated 1 oz. of silver per square foot.
- 2 AMALGAM SAFES.
- 1 BELT TIGHTENER, complete with pulley, boxes, etc., for main belt.
- 1 BELT TIGHTENER, complete with pulley, boxes, etc., for crusher.
- 1 CORLISS ENGINE, built by Fraser & Chalmers, cylinder 20" diameter by 48" stroke, complete in every particular, shaft 10" in diameter, band flywheel 16" diameter, 30" face; weight, 42,000 pounds.
- 3 HORIZONTAL TUBULAR BOILERS, 54" diameter, 16' long, complete with steam drums 30" x 72", mud drums 18" x 66" for each boiler, breechings, smoke box, stack 48" diameter 60' long, all necessary guy rope, half arch fronts, grate bars, cast and wrought iron parts necessary for setting, feed, blow off check and safety valves, gauges and all fittings. Weight, 51,000 lbs. At present these boilers are arranged for setting in one battery. We will make any changes required, furnishing stacks and other items necessary to set each boiler separately.
- 1 HEATER, tubular, 30" diameter, complete, with exhaust pipe.
- 2 NO. 5 KNOWLES BOILER FEED PUMPS.
- 1 BERRYMAN HEATER, 18" diameter by 7' long, copper tubes, 4" pipe inlet and outlet.
- 1 HOOKER VERTICAL SINKING PUMP, 14x8x14, 6" suction 5" discharge.
- 8 ORE CARS, one ton capacity each.
- 1 WATER WHEEL, 50 H. P.
- 1 16" BULLION FURNACE, complete, including 10" Gold Retort, stack and all iron work.
- 1 NO. 5 STYLE B GATES FINE CRUSHER.
- 1 LOT REPAIR PARTS FOR HUNTINGTON MILLS, including roller shells, ring dies, scraper bars, shoes, screens, clamping plates, all new, never used.
- 1 LARGE LOT OF PIPE AND FITTINGS.
- 1 LOT BOLTS, WASHERS, RIVETS AND NUTS.
- 1 LOT OF MISCELLANEOUS SHAFTING, PULLEYS, PILLOW BLOCKS, HANGERS, ETC.
- 120' RUBBER BELTING, 28", 6-ply.
- 58' RUBBER BELTING, 18", 4-ply.
- 150' RUBBER BELTING, 16", 4-ply.
- 70' RUBBER BELTING, 14", 4-ply.
- 2 LOCOMOTIVES, 20" gauge, built by H. K. Porter Co., Pittsburgh, one 6x10 cylinders, the other 8x14 cylinders, both saddle tank.

A Dry Pulverizer

FOR ORES, CEMENT and
HARD SUBSTANCES.

Equals a 50-ton stamp mill. Grinds to any mesh under 8.
No slimes, no choking. Takes any fineness of feed under 1 in.
No special foundation. No quartered belts. No internal screens. Outside separation gives 100 per cent product most uniform and granular.
No oil in product. No stoppages for oiling or adjusting.
Can be used wet. Can be moved on a truck.
Guaranteed for one year. Free new for worn out parts.
Little wear, no duplicate parts, no break-downs.
Cost 1/4 to 1-1/2 of any installation of same capacity.
Takes only one-half the horse power. Is automatic.

For Particulars and Catalogue

KENT MILL CO., 5 Beekman St., NEW YORK.

THE SNODGRASS HAND POWER COMMON SENSE PULVERIZER & CONCENTRATOR.

This Hand Power Machine is built on the same general principle as the regular machines, only being smaller in size and capacity. While this is intended to be run by hand power, it can easily be changed for steam or gasoline by simply putting on the pulley in place of the gearing. This has a capacity of 1 1/2 to 2 tons per hour. This is just the machine for working at Cape Nome and other places where it is difficult to procure wood, coal, or gasoline for power. It requires but a small amount of water, and a pump can be attached, so that one person can pump the water as well as run the machine. It can easily be moved from place to place, as the heaviest part only weighs about 350 lbs., the total weight being about 500 lbs.

Address S. K. SNODGRASS, DENVER, COLO. (The Windsor.)

THE COLORADO IRON WORKS COMPANY,

ENGINEERS AND MANUFACTURERS OF

Smelting Furnaces and Equipments.

The illustration in this advertisement shows one form of our COPPER MATTING FURNACE, employing hot blast; the air being first treated in proper appliance, is conducted through the cast iron bustle pipes placed along the inside of the caisson plates, through the cast iron adjustable tuyeres. This furnace can also be used for silver as well as copper smelting, by changing lining in crucibles. We build them in any size required.

Cold blast may be used if preferred.

The furnace is equipped with our special cast iron jackets, and our patented system of water-jacketed mantles.

Send for our catalogue, showing many different styles of smelters for the treatment of

GOLD, SILVER, LEAD, COPPER AND NICKEL ORES,

also the latest and best method for the economical use of jacket water (a saving of 80% to 90% guaranteed) by our patented

WATER VAPORIZING ATTACHMENT.

We design, manufacture and erect Mills for Concentration and Amalgamation, Milling, Chlorination and Cyanide Processes. In writing for information, give us the analysis or character of the ore to be treated, to enable us to intelligently arrive at the proper method.

Our very complete catalogue of CRUSHING MACHINERY will be sent on application.

Stamp Guides.
LIBERTY BELL GOLD MINING COMPANY,
KANSAS CITY, MO., U. S. A.

ARTHUR WINSLOW, GEN'L. MANAGER AND CONSULTING ENGINEER

100 WEST 5TH ST., KANSAS CITY.

J. W. MERCER, Esq.,
Telluride, Colo., Jan. 22/19 01.

Globe Iron Works,

Stockton, Cal.

Gentlemen:--

We hereby place with you, order for Globe Guides for seven batteries of five stamps each, of the same dimensions and character as the set which you sent us last fall. We are pleased to say that these guides have given us entire satisfaction, and we intend to replace all of the guides on our old batteries with your pattern.

Kindly advise how soon you can ship this order

Yours truly,

LIBERTY BELL GOLD MINING COMPANY

By

Arthur Winslow
General Manager.

DOUBLE CYLINDER SINGLE DRUM HOISTS.

The above form of Hoisting Engine has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes which assures quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, silty or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

SMOOTH-ON COMPOUND

AN IRON CEMENT

For repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts the same as iron, insuring a tight joint at all temperatures. Difficult flanged connections can easily be made with SMOOTH-ON COMPOUND, as it adapts itself to the flanged faces, whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching.

ASSESSMENT NOTICES.

ALLIANCE EXPLORATION & MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Ophir, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of February, 1901, an assessment (No. 3) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 236 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of April, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,
S. GOLDSMITH, Secretary.

Office—236 Sutter street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of December, 1900, an assessment (No. 20) of Ten (10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 2nd day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,
JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of January, 1901, an assessment (No. 9) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of February, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 18th day of March, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,
N. F. REMINGTON, Secretary.

Office—112 Main street, San Francisco, California.

And in accordance with law, and an order from the Board of Directors, made on the 13th day of December, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, No. 310 Pine street, room 35, San Francisco, California, on TUESDAY, the 19th day of February, 1901, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Office—310 Pine street, room 35, San Francisco, California.

DELINQUENT SALE NOTICE.

MAY DAY GOLD & SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 5) levied on the 30th day of November, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
William H. Chapman.....	42	100	\$5 00
Thos. A. DeLay.....	43	600	30 00
Thos. DeLay, Trustee.....	88	6,000	300 00
Thos. A. DeLay, Trustee.....	90	5,000	250 00

And in accordance with law, and an order from the Board of Directors, made on the 30th day of November, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, at Heald's Business College, No. 24 Post street, San Francisco, California, on TUESDAY, the 19th day of February, 1901, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Office of Company—Heald's Business College, 24 Post St., San Francisco, California.

Patents for Pacific Coast Inventors; Notices of Recent Patents; Personal; Recently Declared Mining Dividends; Books Received, 109.

THE following would be a good law for the present California Legislature to pass: SECTION 1. Every miner shall have the right of way across any and all mining claims for the purpose of hauling quartz and all mineral-bearing ores, wood, timber, and all supplies for mining purposes to and from his claim. SEC. 2. This Act shall take effect immediately.

RECENTLY, in answer to a question, this paper stated that it did not know of any tin being commercially produced at present from any mine in the United States. F. H. Carpenter of Deadwood, S. D., says that "there is enough tin in the Bear Gulch, S. D., mining district to supply the United States with tin indefinitely," which is important if true. He says "in many miners' cabins there are to be found piles of cassiterite, the accumulations of a dozen summers." The further statement is made that New York and Philadelphia men have bought a group of tin-bearing claims in the district named, and will put in a 150-ton concentrating plant. Mr. Carpenter further states that he "has sat by the hour breaking tin ore on one of the big tin ledges in the Bear Gulch district, in a vain effort to find a piece of rock that did not carry tin values," and that "there are numerous ledges of tin ore in the Bear Gulch district that will average from 2% to 5% tin." All of which is commended to the attention of the mining world as of considerable present interest.

THERE appears to be internal if not intestinal trouble in the affairs of the American Smelting Co., the combine of the American Smelting & Refining Co. and the Guggenheims, concerning which so much has recently appeared herein. On the 10th inst. Mr. Rogers and Mr. Lewisohn, prominent directors of the A. S. & R. Co., wrote their resignations. The meeting of the stockholders of that company to increase the capital stock from \$65,000,000 to \$100,000,000, for the purpose of absorbing the Guggenheim interests, was called for the 16th inst., but a temporary injunction was secured by those opposed to such absorption, restraining the officers of the company from such increase of the capital stock. The complaint on which the injunction was granted alleges that the Guggenheim property was not worth what the company proposed to pay for it, and that, as the proposed purchase would establish a complete monopoly in the business of smelting and refining gold and silver ores in that part of the country in which such smelters and refineries were operated, the combine would be subjected to all the penalties prescribed by U. S. Statute against such monopoly.

Old Readers and New.

It is usual for frequent inquiry and answer as to something in mining or metallurgy that betokens lack of expert knowledge but sincere desire for exact information on that particular point, and, occasionally, comes a gentle little criticism or remonstrance from some old and valued subscriber regarding the appearance of just that kind of information in some previous issue just to hand, the latter expressing some surprise that this paper should publish what so many miners are already supposed to know, and courteously intimating that there is so much of immediate improvement and knowledge transpiring that it should be unnecessary to publish anything presumably known already.

As between the two, the paper prefers to risk the displeasure of a few older patrons in the interest of the many new, for while the appearance of such primary information may not be necessary to some readers, yet just such points are what attracts great numbers of newer readers, who expect reliable and exact information of value in their daily work, in every department of mining and metallurgy. It has been the pleasure and the privilege of the paper for forty years to chronicle all improvements in mining and metallurgy, and the history of this paper is the history of scientific metal mining in the United States. But many who learned all about those things and told of them in these columns are passing away, or engaging in other pursuits, and, pressing on their footsteps, come a legion of new men who know no more about those things now than those who learned and told of them years ago did when they, too, were beginners; and it continues to be the province and the purpose of the paper, while giving the very latest in all branches of the industry to which it is devoted, to also supply whatever information is asked, no matter how rudimentary it may appear, in the knowledge that it is still thus fulfilling its mission, this conviction being confirmed by the numerous letters constantly received.

Take, for instance, the cyanide process. For years this paper has published the latest and most valuable concerning the practical operation of that process, and the articles so published have been the basis of the great development in gold extraction from low-grade ores susceptible of treatment by that process. A little item from an El Oro, Mexico, correspondent, in last week's issue, illustrates one phase of such growth, in stating that in that one district are now being treated 20,000 tons of ore monthly by the cyanide process. Probably the men who are treating that ore first learned of its applicability thereto by expert articles that have appeared in this paper, and it is of equal probability that, while they would gladly welcome the latest and newest development in the cyanide process, yet they might now, with some degree of impatience, read some article in this paper explanatory of this process, cost, details, applicability to certain ores, inapplicability to other ores, etc., that they learned years ago and know all about now, yet, being the very thing that some tyro with a mine and money to spend and earnest desire to learn, wants to find out, and naturally asks for information from the best obtainable source. Of course, were this paper or any other paper to merely publish such details already known to many, though of coming interest to many more, it would not be of material value to the adept or proficient. But in addition to such occasional references are also published weekly expert information from those who know all about it. Indeed, it is believed there is no paper in the United States that yearly publishes more original matter, written by the very men who are doing the things that they write about.

This is in kindly answer to the friendly suggestions mentioned, and its propriety will probably be conceded. The men who are only beginners to-day will be in time the equals, we hope, in proficiency of those in present practice. Meanwhile those men have money to buy machinery and appliances, they want to employ men, develop mining property, and are really the hope and stay of the future mining industry; they represent the coming men—some of them arriving, others having their attention turned to the importance of the great basic industry of the nation, the future it affords and the opportunities for advancement and profit, and in a few years they will be the majority.

Tardy But Effectual.

The U. S. Circuit Court of Appeals at San Francisco has done some justice to the mining industry by sending one A. McKenzie to jail for one year and by censuring his colleague in Alaska who disgraces the court in which he acts as judge. The facts are well known to every miner. Rich placer gold deposits were discovered at Cape Nome, Alaska, in 1899, and upon opening of navigation in 1900, nearly 30,000 people rushed there. The territory of Alaska was divided into two judicial districts and Arthur Noyes, of Minneapolis, Minn., was appointed as District Judge for the northern district, which included Cape Nome. With him went A. McKenzie, of North Dakota. It was a great opportunity for a weak judge and a corrupt ally, far from ordinary reach, with the power of the United States behind them in a new country rich and remote. The unsettled conditions made it possible to use the machinery of the law to wreak wholesale injustice and despoil miners of their rights. The procedure was simple but effective. Immediately when a claim was shown to have worth some satellite of the court's perjured himself by setting up title to it, and another of the gang, an "attorney," would go before Judge Noyes and ask for the appointment of a receiver pending litigation as to ownership. Judge Noyes promptly appointed his friend McKenzie, and the rest was easy. The real owner, the miner who had bought and developed the claim, was dispossessed "by law," and his claim worked continuously, day and night, so that the last ounce of gold could be taken out before Nemesis overtook them in the shape of legal injunction from San Francisco. When such injunction did arrive, it is asserted that Judge Noyes found it convenient to remain unseen or at least unfound for five days, during which time McKenzie "cleaned up" the gold contents of the claims he had clutched with even more than ordinary vigor.

Meanwhile, as is their wont, the miners were law-abiding, and though sorely tried patiently awaited redress. They would have been justified in summarily ridding themselves of such vultures, but with commendable patience waited to the end. The end was that two United States Marshals came to Nome, and carried McKenzie in custody to San Francisco, where his attorneys fought through every quibble and trick of technicality with the result that McKenzie was sent to jail and his "Honor" the judge severely scored by the Court of Appeals. At present no actual punishment by incarceration has been accorded him, but probably some measure of disgrace attaches by his consciousness of his own identity, as he can hardly help a feeling of contempt for himself.

Meanwhile there will be protection in the future for the miner in Alaska, and thieves in and out of courts have everywhere been taught a salutary lesson.

THE recent ruling of Commissioner Herman of the U. S. General Land Office in the case of the California land "scrippers" was in accordance with justice, in favor of bona fide petroleum miners. But California oil men can not rest in security; for, though the General Land Office has ruled that the miner who has located an oil claim in California, and who has satisfactorily proved the mineral character of the land, can hold it against any "scripper" who pretends that it is agricultural, yet such ruling is not final. The matter comes up for adjudication before Secretary of the Interior Hitchcock on the 13th prox.; and, as that official has already shown his leanings toward the side of the "scripper," it is necessary for the oil men to furnish such showing as will make proper representation of their case. It is now before the Assistant Attorney-General of the United States; and, while he is no doubt an able and impartial gentleman, yet previous rulings from the Interior Department on such matters have indicated more knowledge of the technical letter of the law than of its proper spirit and application. The matter is an important one to California oil interests. The California Petroleum Miners' Association and the California State Miners' Association have just succeeded in defeating a "cinch" bill in the California Legislature, and their prompt, united effort may be equally successful in averting a probable peril at the national capital.

Concentrates.

PROTOGENE is granite in which talc takes the place of mica.

PARAFFINE OIL is considered best for insulating induction coils.

THE chemical name of the acetylene used for lighting purposes is ethine.

THE loss of mercury varies from 15% to 50% in the case of cemented gravels.

A **VALID MINING LOCATION** may be made by a minor, a woman, a citizen or a corporation.

GOLD is absorbed by new copper plates at an approximate rate of half a pennyweight to the ton of ore milled.

THERE is a constant loss of heat in water used for cooling the cylinder of a gas engine, which could be practically utilized.

THEORETICALLY the horse power of 40 miners' inches, 100 feet fall, would be 9.6588; practically it would be from 50% to 80% of that.

IN early California hydraulic practice it was not unusual in sluicing to have as much as 4000 pounds of mercury in use at one time.

A **POUND OF ZINC**, when cut in shavings such as are used in the cyanide process, would expose from 1500 to 1600 square feet of surface.

THE "Durango Bay" mine, Red Mountain, King county, Wash., is one of the customary swindles, and only deserves notice to be condemned.

SULPHIDE OF GOLD can exist in the colloidal state—i. e., in a condition resembling glue or jelly—and is then soluble in pure or slightly acidulated water.

PLATINUM WIRE is used in the base of incandescent lamps, as it is the only metal which expands and contracts with heat at the same rate as the glass.

NO ONE can exclusively appropriate to his own benefit a geographical term so as to prevent others inhabiting the same or similar territory from dealing in similar articles.

AURIC CHLORIDE warmed by an alkaline solution of peroxide of hydrogen is at once reduced to metallic gold. This reaction serves as a means of separating gold from platinum and iridium.

"THE sum of \$300,000,000 pure gold," if "in the shape of a ball," would in such globular form represent a sphere a little over 12½ feet in diameter, giving gold a value of \$20.671834625 per ounce.

METALLURGY in its more theoretical aspect is the science of extracting metals from their ores. Viewed from a commercial standpoint, it is the science of profitable extraction of money from the ore.

INFUSORIAL EARTH is the standard material for dynamite or "giant powder" manufacture, but wood flour is sometimes used as a cheap substitute. The latter is made by grinding sawdust to a fine powder.

ANEROID BAROMETERS may be used to measure the depth of shafts in mines, provided a number of trips are made and the average taken, the cage, in no instance, to be stopped in transit between surface and bottom.

FOR drill work in hammered steel the atoms are condensed and made of closer texture; rolled steel elongates the particles. The latter costs less, originally. The best is the cheapest in the long run—or the short run.

ANTHRACITE COAL requires for complete combustion eleven pounds air per pound of coal—132 cubic feet air at 60° F.; kerosene requires about eighteen pounds air per pound of oil or 235 cubic feet; gasoline about the same as coal.

WERE the earth to cease rotating the Mississippi would flow toward the north. The southern end of a water level line north of the equator is higher than its northern end, because of the bulging of the sphere at its central line.

TO **AVOID** the waste of oil in the ordinary oil can, fit the end of the oil can spout off at a bevel. One can then slip it under the lids of the journals without touching them with the hands, and the stream of oil can be carefully directed.

IRON and steel are used extensively for "timbering" and other mine use in Europe, where suitable wood is scarce, but, except in rare instances, there is no use of such substitute for ordinary timbers in the metal mines of this country.

ANY mineral lands in any forest reservation which have been or which may be shown to be such, and subject to entry under the existing mining laws of the United States, are subject to such location and entry in the usual manner.

OWNERS of valid mining locations made and held in good faith may fell and remove therefrom any timber growing thereon for actual mining purposes in connection with the particular claim from which such timber is felled or removed.

TO **FIND** the diameter of the steam pipe for an engine, multiply the square root of the engine horse power by .408; the product will be the diameter of the pipe in inches. Assuming the engine to be 100 H. P.: $\sqrt{100} = 10$; $.408 \times 10 = 4.08$ inches diameter.

WHEN a mining corporation, in good faith, works, by ordinary mining processes, deposits of stone and other

mineral on its lands, with a view to utilizing the product for commercial purposes, the land so worked is "mining ground," within the law of California.

IN the use of crushing rolls where fine product is desired, the ore materials delivered to the machine, divided into four sizes, may be estimated, approximately: Passing a 4-mesh screen, 40%; passing a 2-mesh screen, 30%; passing a 1-inch-mesh screen, 2%; larger, 10%.

CONCENTRATION of cinnabar ore is practicable, but not practical, as it would ordinarily cost about as much to concentrate the ore as to treat it direct, just as it comes from the mine. Almost any method of cinnabar ore concentration would cost as much as furnace treatment.

WHAT is believed to be the largest blast furnace for lead smelting is in use at the Pertuola Works, Italy. It is the Pilz furnace, has a double series of tuyeres, twelve being 30 inches above the furnace bottom and twelve 4 inches higher. The same type of furnace is in use at Freiberg.

ON the Rhine, Volga and other European rivers, and in canals, barges, tugs and boats are hauled up stream by means of a rope or chain laid in the bed of the stream, picked up by the vessel, passed over a revolving winding drum and dropped astern, giving slow but steady progress.

WITH a sluice 1000 feet in length the most of the mercury is to be distributed along the upper 250 feet, the remainder along the next 400 feet. About 500 pounds, with one-fourth of that amount for the undercurrents, would be a fair charge, mercury being added in much smaller quantities.

THE formula for silver solder is: fine silver, nineteen pennyweights; copper wire, one pennyweight; brass wire, two pennyweights; melt in crucible under a coat of powdered charcoal; when melted pour into a bucket of clean water to granulate, then pour into a wooden mould and hammer into a thin sheet.

IT is useless to attempt further information regarding molybdenum; all procurable data has been published and republished in former issues. The supply fully equals the limited demand. If the molybdenite ore carried about 58% or 60% molybdenum, and was free from copper, it might bring \$175 per long ton at the mine.

THERE is a large deposit of lepidolite near Pala, San Diego Co., Cal., rich in lithium and potash, and of value in the manufacture of lithium salts, which are used extensively in medicine. The chief source of supply is from Germany, the consumption averaging in this country 50,000 pounds per annum, worth about \$4 per pound.

THE necessary diameter of a required pipe can be determined where the volume and velocity of the water are known: multiply the number of cubic feet of water by 144; divide the product by velocity in feet per minute; the quotient is the area; divide this by .7854; the square root of this last quotient is the diameter required.

DURING the last fourteen years California has produced about 10,000 tons of manganese ore, worth about \$10 ton. Russia supplies more than half the world's manganese. Chile is also a large producer. The metal is worth wholesale (98%) about \$1.10 per pound, New York. "Chemically pure" manganese is worth about \$100 per pound.

IN battery screens for gold milling wire screens take their numbers from the meshes to the linear inch; perforated and slotted screens from the needle used in punching them. In gold milling No. 6 to No. 9 perforated and slotted screens have mesh 25, 30, 35 and 40, respectively, their weight in pounds per square foot being, respectively, 1.08, 0.987, 0.918, 0.827.

THAT one of two joint locators of a mining claim is not a citizen of the United States, but the other is, does not invalidate the location, and a joint conveyance by them vests a valid title in the grantee. A recital in the location notice of a mining claim that it is the relocation of another mining claim is an implied admission of the validity of the former location.

UNDER the laws of California a stockholder of a corporation is individually liable to each creditor of the company in the amount determined by such a part of each claim as each stockholder's stock is a part of the stock of the company. An action may be brought against any stockholder in the courts of any State where service may be had to recover the amount due the creditor.

EXPERIMENTS of Hadfield, Barrett and Brown indicate that steel containing nickel 25.00, manganese 5.05, carbon 0.60 has the highest resistivity of any commercial metallic conductor yet produced, being equal to 97.52 microhms per cubic centimeter at 15° C., giving to the alloy a resistivity sixty times greater than that of pure copper, ten times that of iron and four and five-tenths times that of German silver.

By the "life of a mine" is ordinarily understood how long its active working or development will result in any net profit. Many factors enter into the problem: the amount of the mine's ore contents; the rate of ore treatment (including capacity of mill); the manner of working, demand for dividends, etc. The "life" of an unproductive or unprofitable mine depends on the faith or financial ability of its owners.

ONE **LOCATION** of 160 acres placer ground is sufficient, but there must be a mineral discovery on each twenty acres thereof. This, however, applies only to an asso-

ciation of eight persons. An individual locator can not enter more than twenty acres in any one placer claim or location. Work on a ditch or canal can be applied to the assessment work for the common benefit or development of contiguous claims held in common, if sufficient in amount to equal such required expenditure upon all the claims.

MATTE SMELTING is a species of concentration, and comes under the general head of ore dressing. Wet concentration is almost entirely based on the difference in specific gravity between metal-carrying minerals and waste material. There may be in the same ore material with 2½ specific gravity; galena, 7½ to 8 specific gravity; iron and copper pyrites, 4½ to 5 specific gravity, and other metals lighter and heavier. This difference is affected and adjusted by wet concentration.

A **MIXTURE** to imitate marble and take a fine finish may be made by reducing marble dust or white crystallized limestone to a very fine powder by grinding and sifting and intimately mixing one-fourth its weight of zinc oxide (zinc white) and one-eighth its weight of Portland cement, mixing thoroughly into a thick paste with a 40% aqueous solution of hot water glass. By moulding the paste under pressure and exposing the moulded form to warm, dry air for a week it can be polished.

A good petroleum joint with common iron pipes can be secured by heating both the male and female threads sufficiently to dissipate every trace of oil and then make the joint up with thick shellac varnish, which may be combined with ordinary dry vermilion or even Venetian red. A good joint can also be made with ordinary yellow bar soap rubbed into the threads of the pipe, the grease first being removed. Treacle, honey, glue, mucilage and glycerine are also petroleum-proof. For a stuffing box, ordinary wicking saturated with common yellow bar soap may be safely employed.

IRON PIPE expands at the rate of .00000648 of a foot for 1° F., and for 1 foot in length. If the pipe is put up at a temperature of 60° F., and the highest pressure of steam to be carried is 100 pounds by the gauge, then an allowance for expansion is to be made accordingly: the difference in temperature between that at which the pipe is put up and that due to steam at 100 pounds pressure is 338 — 60 = 278°. For 1 foot in length, the expansion being .00000648 of a foot, for 100 feet it would be .0000648 × 100 = .000648 of a foot for 1°, and for 278° .000648 × 278 = .18 of a foot, or 2 $\frac{1}{8}$ inches.

THERE is now available for the work of restraining barriers in the Yuba river, California, the sum of \$650,000; \$250,000 of this was appropriated by the Federal Government and \$400,000 by the State; \$150,000 of the latter was appropriated last week and will be available when required. It is understood that the California Debris Commission will immediately begin the work, and that Congress will make additional joint appropriation of \$150,000 at this session or the next one, making the total of \$800,000 estimated to be required by the U. S. engineers for the successful completion of the work.

CANVAS, saturated with shellac varnish, makes a good washer, but soft metallic washers are better. A good flexible diaphragm for a regulator may be made of closely woven cotton fabric, varnished on both sides with a compound of gelatine and glycerine; about equal parts by weight make a tough and elastic compound. Wooden vessels and bags may be made petroleum-tight by saturating or varnishing with this compound. As a rule, all substances which are soluble in water are insoluble in petroleum. For stuffing boxes for standing both water and petroleum, castor oil is recommended, as this peculiar oil seems insoluble in either.

SOME American lubricating oil for machinery has a specific gravity of 0.92, a flash point of 206, a viscosity (water = 1 at 0° C.) at 80°, 4.23; at 100°, 1.65; for steam engine cylinders, specific gravity 0.886, flash point 283, viscosity at 100°, 4.17; at 150°, 1.78. Russian oil for lubricating engines has specific gravity 0.909, flash point 197, viscosity at 80°, 6.28; at 100°, 1.76; for cylinders, specific gravity 0.916, flash point 215, viscosity at 80°, 11.65; at 100°, 2.21; at 150°, 1.42; for general purposes, specific gravity 0.908, flash point 138, viscosity at 80°, 8.84; at 100°, 2.05. German lubricating oils for machinery, specific gravity about 0.923, flash point 1.55 viscosity at 50°, 15.48; at 100°, 2.69; for general purposes, specific gravity between 0.910 and 0.994, flash point between 162 and 135, viscosity at 50°, 3.84 and 3.17, respectively; at 100°, 1.63 and 1.40, respectively.

THE inch is equivalent to 2.54 centimeters; the foot to 30.48 centimeters; the yard to 91.44 centimeters; the mile to 1609.33 meters; the nautical mile to 1852.30 meters. The square inch is equivalent to 16.387 cubic centimeters; the cubic foot to 28.316 cubic decimeters; the cubic yard to 764.535 cubic decimeters; the pint to 0.567 cubic decimeter; the gallon to 45.410 cubic decimeters. The grain is equivalent to 64.799 milligrams; the ounce avoirdupois to 28.349 grams; the pound to 453.590 grams; the ton to 1016.050 kilograms. The foot pound is equivalent to 0.13825 kilogrammeter; the French horse power to 75 kilogrammeters a second; the English horse power (550 foot pounds a second or 33,000 foot pounds a minute) to 76 kilogrammeters a second. The metrical unit of pressure is the kilogram per square centimeter. We may also count by centimeters of mercury or by atmospheres. A pressure of one atmosphere corresponds to a column of mercury 76 centimeters high, or to 1.033 kilograms per square centimeter. The pound per square inch corresponds with 70.3 grams per square centimeter.

Power Required by Stamps.

Written for the MINING AND SCIENTIFIC PRESS by A. W. WARWICK.

The power consumed by a stamp battery is a matter about which we know too little. It seems as if, after fifty years of use, we should be able to take the design and calculate, with some degree of accuracy, the power required to operate the mill. An examination, however, of the numerous text-books, manuals and pamphlets on stamp milling fails to disclose any adequate formulæ for the calculation of the power required by a stamp. Take, for example, that admirable little pamphlet by Preston on "California Gold Mill Practices." On page 32 the power required for 850-pound stamps, drop 6 inches, 95 times per minute, is given as 1.33 H. P. After examination of over 100 diagrams, taken from various stamp-mill engines, the writer can say with assurance that 1.33 H. P. is at least 50% too low for the stamps quoted.

Henry Louis, in his "Handbook of Gold Milling," is the only writer who has endeavored to work out mathematically the power required by a stamp. He has given formulæ for finding (1) the friction of cam shaft in its bearings, (2) friction between cam and tappets, (3) friction of stem in guide and (4) dead lift of stamp, the sum of the powers required to overcome these resistances being the power required to lift the stamps. In applying these formulæ, however, the present writer has found a serious discrepancy between the actual power, as found by indicator diagrams, and the calculated power. Thus, in a 10-stamp mill, the following results were obtained:

Actual power per stamp 850 lbs., 6 in. drop, 90 per min.	1.785
Calculated power per stamp 850 lbs., 6 in. drop, 90 per min.	1.393
Error	0.392

An error of nearly 30% in the calculated power is far too great to be due to accidental causes; such an error should not be tolerated in good engineering practice. It seems, therefore, that there must be either some error in the determination of the H. P. by the engine indicator, or that there is something wrong with the Louis formulæ. The actual power given is the average of a great many determinations, all of which agree within the ordinary limits. Moreover, the power given agrees with numerous other power determinations of other stamps. On the other hand, careful examination of the mathematical processes followed by Louis fails to discover any error. It is clear, therefore, that some factor exists which has a disturbing influence, and which was overlooked by Louis.

The formulæ for calculating the power required by a stamp may be given in the following simplified form:

$$\text{Friction of cam shaft} = \frac{\text{wt. on shaft} \times \text{diam.}}{2 \times 90} \quad (1)$$

$$\text{Friction between cam and tappet} = \text{length cam curve in ft.} \times \text{wt. stamp} \times \text{coef. friction.} \quad (2)$$

$$\text{Friction between stem and guide} = \text{horiz. thrust due to cam} \times \text{drop of stamp} \times \text{coef. friction.} \quad (3)$$

$$\text{Dead lift of stamp} = \frac{\text{wt. stamp} \times \text{drop in inches.}}{12} \quad (4)$$

These formulæ give the foot-pounds absorbed, or required, for one drop of the stamp.

$$\text{Horse power required per stamp head} = \frac{\text{sum of formulæ 1, 2, 3, 4} \times \text{no. drops per min.}}{33,000} \quad (5)$$

Applying these formulæ to the stamps, above considered, the following results were obtained:

	F. P. per drop.	H. P.
Friction on cam shaft.....	22.00	0.060
Friction on cam and tappet....	62.33	0.170
Friction on guide and stem....	1.83	0.005
Dead lift	425.00	1.158
Totals.....	511.16	1.393

The result is, as we have seen, much too low.

A consideration of the properties of the orthodox cam curve—an involute to a circle—will show that the uniform rotation of the cam shaft gives a uniform upward motion to the stamp. Now, when the cam engages the tappet, the latter being at rest, inertia comes into play and the tappet can not instantaneously move at the instant of engagement. The result is that the tappet must have a pressure against the cam greatly in excess of the dead weight of the stamp. This is perfectly clear. The point is now, can this pressure be measured? This is fortunately the case both by calculation and actual measurement. As we are calculating the power strictly from the point of view of the battery design, we will here only consider the calculation, leaving the demonstration till further on.

If we consider that at the moment of release of tappet and cam the former has an upward motion, we see that inertia again comes into play and the stamp will continue to move upward until its energy is spent against the action of gravity. This terminal inertia, the effect of which can be readily calculated, must be strictly comparable to the initial inertia

against starting—neglecting friction of guides, etc., which is extremely small.

Examination of the mill drawings gives us all the data required to calculate the upward velocity of the tappet as it leaves the cam. From this we can readily calculate the distance it will be thrown. The formula for the time occupied in the lift of the tappet is

$$\frac{H}{\pi r} \times \frac{60}{N} \quad (6) \text{ where } H = \text{lift in feet, } \pi = 3.1416, r = \text{distance between centers of cam shaft and stem, } N = \text{number of drops per minute.}$$

In the case under consideration $H = 6$, $r = 6$, $N = 90$, and the time occupied in the lift was 0.212 second. The height of the lift being 6 inches, the velocity is, therefore, 2.35 feet per second. The tappet will rise, after leaving the cam, a distance of $\frac{v^2}{2g} = \frac{2.35^2}{64.4} = 0.0857$ foot, or 1.028 inches; the total lift becomes 7.028 inches.

It is obvious that a cam adjusted to a 6-inch lift will actually raise the stamp (850 pounds) 7.028 inches. It will also be obvious that the cam does the whole work during its 6-inch lift; therefore, calling W the weight of the stamp, H the actual height to which it is lifted, w the pressure against the cam, h the height during which the cam works (or is in contact with the tappet), then

$$w \times h = W \times H, \text{ or } w = \frac{W \times H}{h} \quad (7)$$

Applying this to our stamp calculations, we have $w = \frac{850 \times 7.028}{6} = 995$ pounds. We thus see that the dead weight of 850 pounds gives an actual live weight on the cams of 995 pounds, and this latter figure should be used in calculating mill proportions, power required, etc., instead of 850 pounds per stamp.

The writer believes that this factor of inertia is

0.119. In the present case the length of cam curve is 10½ inches, by measurement. Then we have from formula (2) $\frac{10.75}{12} \times 995 \times 0.119 = 106$ f. p. per drop, = 0.2890 H. P. per minute.

FRICTION BETWEEN STEM AND GUIDE.—There should be no friction in guides except that caused by side thrust of the cam, due to the latter working at one side of the center line of the stem. This side thrust is found by the formula $\sin. \text{ angle} \times \text{pressure of stamp on cam}$. The angle is very small, not more than 2°; the value of the sine of 2° is $\frac{1}{25}$. The side thrust is, therefore, $\frac{995}{30} = 33.2$ pounds. The friction

of the guides only acts against the engine during the time the tappet is on the cam, or through 6 inches. The friction in each guide is, according to formula (3), $33.2 \times \frac{6}{12} \times 0.119 = 1.97$ f. p. per drop.

There are, however, two guides, and the friction is practically the same in each; therefore, the total loss in power is 3.94 f. p. per drop, or 0.0107 H. P. (Louis has only calculated the friction lost in one guide. This must surely be an oversight, because there can be no doubt as to the point that power is lost by friction in each guide, and to practically an equal extent).

DEAD LIFT.—The cam actually forces up the stamp to a height of 7.028 inches, instead of the 6 inches at which it is set. The stamp must derive the power to do this from the cam, and therefore the dead lift should be calculated from 850 pounds $\times$ 7.028 inches, or 995 pounds $\times$ 6 inches, the result being the same in each case. The dead lift is $\frac{995 \times 6}{12} = 496.6$ f. p. per drop, or 1.3543 H. P. per minute.

Assembling these results and comparing them with

the one overlooked by Louis. The effect of inertia interpolated into the formulæ 1, 2, 3, 4 will, or should, give us a very close approximation to the actual horse power required by a given stamp of a certain design. The calculations are given somewhat in detail, replacing the weight of the stamp (850 pounds) by our calculated pressure against the cams (995 pounds).

FRICTION IN CAM SHAFT BEARINGS.—The weight on the cam shaft is made up of (1) number of stamps supported simultaneously; (2) weight of cams; (3) weight of bullwheel; (4) pull of belt; (5) weight of cam shaft. The number of stamps supported simultaneously is obtained from the formula $\frac{h s}{\pi r}$, where h = lift, s = number of stamps on shaft, $\pi = 3.1416$, r = distance center to center of cam shaft and stems. The number of stamps supported simultaneously in the case under consideration was 2.7. The diameter of the shaft is 5½ inches.

	Pounds.
2.7 stamps at 995 pounds.....	2686
Weight of cam shaft.....	1250
Weight of bullwheel.....	2250
Weight of cams.....	1560
Pull of belt (approximate).....	850
Total weight on bearings.....	8596

$$\text{Then } \frac{8596 \times 5\frac{1}{2}}{2 \times 90} = 244.7 \text{ f. p. per drop} = 0.667$$

H. P. per minute for ten stamps; proportion for one stamp, = 0.0667 H. P.

FRICTION BETWEEN CAM AND TAPPET.—The length of the cam curve, where it cannot be measured, can be calculated from the formula $\frac{2 K h + h^2}{2 r}$, where K = height from center of cam shaft to point of engagement of cam and tappet, h = height of cam lift, r = distance from center to center of cam shaft and stem; coefficient of friction by actual measurement

the calculations from the uncorrected formulæ, the total power required by the stamps under consideration is:

	Corrected	Uncorrected
	H. P.	H. P.
Friction of cam shaft.....	0.0667	0.060
Friction of cam and tappet.....	0.2890	0.170
Friction of stem and guides.....	0.0107	0.005
Dead lift.....	1.3543	1.158
Totals.....	1.7407	1.393
Actual power used.....	1.785	1.785

$$\text{Difference between actual and calculated} = 0.0443 \quad 0.392$$

By the use of these corrections we see that the calculated power is within 2½% of the actual power as found by the indicator. It would be difficult to say which result was the more correct, inasmuch as the indicator itself is not free from error.

These calculations have a practical bearing, in that they allow the mill designer to compute the power required to operate his mill with very considerable accuracy. Another useful application is that they show the frictions to be no negligible portion of the power required to operate the stamp battery; let a millwright compute the friction losses that would be made if he did not absolutely set the stems, cams, etc., as required by the design, and it is safe to say that he would be astonished at the enormous losses of power he would make, to say nothing of the increased wear and tear. The stamp battery can not be too carefully adjusted. The calculations further show that the losses due to inertia are quite important; at first sight, this naturally suggests the question whether a better cam could not be found than the involute to a circle. On this point the writer thinks that cam curve, as generally adopted, can not be improved up.

It was promised above that proof would be given of the fact that the stamp continues to rise after

leaving the cam. In a highly interesting paper written by Louis (Trans. Am. Inst. Mining Eng., Vol. 28, p. 355), an account is given of an instrument capable of analyzing the action of the stamp stem. A diagram is obtained resembling the steam engine indicator diagram, but the former does not give the power diagram—only an autograph of the movements of the stem. The figure given shows the character of the diagram obtained. The horizontal line shows the datum line to which stamp falls. At A the cam engages the tappet and the wavy line at this point appears in every diagram; calculations made from this phenomenon, which is assumed to be caused by inertia, show that the cam strikes the tappet with a blow of about 1700 pounds, acting through a time of about 0.03 second; the space through which the tappet rises in that time is about 1-inch. From the well-known formula $F = \frac{Wv}{gt}$ we can readily figure the blow. Once the tappet reaches constant velocity, the pressure falls to the normal weight of the stamp, 850 pounds.

Then $\frac{1700 \times 1}{6} : 850 \times 54 =$ average pressure on cam, about 990 pounds, thus confirming our purely mathematical considerations. At the point B in diagram the cam and tappet disengage, but the tappet still continues its upward course till its energy is spent. At C the falling stamp comes in contact with the ore, between shoe and die, and does its work. At D the stamp has come to rest, where it remains for about one-tenth second. At E the cam re-engages the tappet and the cycle is repeated. The dotted line shows the theoretical line of the diagram. In the diagram the length of drop given was 5½ inches, but the actual height to which the tappet was lifted was from 5½ to 6 inches, thus proving the point that the stem does rise after leaving the cam. For a 6-inch drop the average of twenty diagrams showed that the lift was from 6.7 to 6.9 inches, an average of about 6.8 inches—or, more accurately, 6.92 inches. The difference between the calculated lift and the actual lift (7.028—6.92) is 0.108 inch, which is due to the friction of guides and vibration. Still, the power given to the stamp is sufficient to raise it 7.028 inches, were there no friction, and this latter figure should be used in calculation, and not 6.92 inches. The results check up so closely all round that the writer is quite convinced that the inertia factor, not being taken into account, has been the cause of the discrepancy between the calculated power and the actual power required by the stamp head.

The Lunkenheimer Injector.

Herewith is shown a sectional view of the new injector which the Lunkenheimer Co. of Cincinnati, Ohio, have placed upon the market.

Referring to the cut, it will be noted that by pulling the lever slightly the steam valve (H) is with-

The Lunkenheimer Injector.

drawn from its seat and steam is admitted to the lifting steam jet (C), through the annular space around the movable steam tube (B). Steam flowing into the water lifting tube (B) forms a vacuum in the water supply pipe and the water is "lifted" and passes out through check valve (A), also delivery tube (E), past the overflow valve (G) to the atmosphere. Drawing the handle further back opens the

ports (I—I) in movable steam tube (B), thus admitting steam to the interior of said tube, which forces the water through combining tube (E) past line check to boiler, due to the closing of overflow valve (G), occasioned by withdrawal of rod (J). The principal feature in this machine is that the regulation of the water is accomplished by the movement of the movable steam tube (B), the amount of which is controlled by the crank handle at the end of the machine. On this account it differs from other forms of injectors, inasmuch as, in cutting down the discharge of water, the steam consumption is reduced in direct proportion. In other forms of injectors the steam supply remains constant, while the water supply alone is reduced.

The manufacturers claim for the injector that it will start promptly under most conditions and can be depended upon to work reliably at all steam pressures from 25 to 300 pounds, and higher. They further claim that it is distinctively a high pressure injector, designed particularly for that service, and that, being self-adjusting—that is to say, it is not affected by variations of steam pressure, even within great limits, and when started, for instance, at 70 pounds—it can be relied upon to work uninterruptedly to 300 pounds, and that a sudden reduction in pressure would not disturb its action. The manufacturers will be pleased to send a complete descriptive circular upon application.

A New Hampshire Mica Mine.*

TO THE EDITOR:—I send you herewith two pictures of the Newfound Mica Mining Co.—one showing the gang in the shaft and the other the workshop and hands after lunch. Our main shaft is about 70 feet deep, and we are now commencing to drive tunnels to the north and south. We get from 1000 to 1500 pounds fine ruby mica at a shot. This mica cuts about 6% into sizes from 1½x4 inches up, and the average is rather above 3x3 inches, considerable as large as 6x8 inches; so that our product brings a good price. Then we find a ready sale for our waste and small-pattern mica. Our mine is located in the main mica lode, which courses from Keene, N. H., to the main State line, and is situated in the town of Alexandria, Grafton county, N. H. I have found and bonded two good prospects—and good ones are scarce. I have one that is a fine vein of smoky quartz and feldspar, with a good exposure of large mica and a fine amount of beryl; this vein is from 60 to 70 feet wide, while the one I am now working is scarcely 20 feet wide.

Mining in Korea.

Written for the MINING AND SCIENTIFIC PRESS by
W. G. ANDERSON JR.

I have spent fourteen months in the Wunsan mines of Korea. It is interesting to note how mining has been carried on by the natives for hundreds of years. The most extensive mining is done by the Oriental Con. M. Co., an American company, who have a large concession—25 square miles—of valuable mining land. They have three modern stamp mills running, two 20-stamp mills and a 40-stamp mill. This concession has only been opened up in the last four years, so it is evident that there is no great drawback to mining in Korea. Large mortars and boilers have been taken to the mines with less trouble than in some cases on our mother lode. Transportation is very cheap. The coast junks carry freight up the Yellow sea and go up the rivers. I have seen a bull cart carry 1600 pounds, and sometimes it takes four mules to haul that much on our California mountain roads.

The Wunsan mines are in the northwestern part of Korea, near the line of Manchuria, China. The whole of Korea is a mining country. The Koreans have been working their mines for hundreds of years. They work down till the water drives them out. They have no pumps and cannot get much deeper than the base of the mountains. Having no powder, they build fires on the quartz and then throw water on the hot rock, causing it to crack. They gad out as much as possible and then pass it to the surface in baskets, throwing the baskets of ore from one man to another. They then carry the ore to their mill, a large, flat rock, with a half-rounded rock on top, with two poles lashed across it for handles.

Two men, one at each end, rock this rounded stone, while another feeds the ore onto the flat rock. When it is ground fine enough it is placed in a heap and panned out. A Korean pan is sometimes a pumpkin shell. The sulphurets are rubbed between two stones and sometimes roasted. On some of these mines over 1000 Koreans are making their living. When a foreigner gets a concession he has these miners driven off, so prospecting in Korea is easy.

The ore is high grade on the surface. Most of the mines are in granite. I have seen a shoot of ore 800 feet in length, 400 feet deep and in some places 14 feet wide. There are also ledges in slate. The natives told me that there are richer mines on the northeast coast. The Chinese say that Manchuria is very rich. Men with money can get concessions, but it is no country for prospectors and the poor natives. The miners get 25 cents per day, car men 20 cents, top hands 15 cents and engineers 30 cents. They make good miners and are faithful.

It costs a Korean all he makes to live. He is a good fellow, like our miners. They differ from the Chinese—have better habits and look like an American Indian and are always happy, always singing at their work. When they don't do their work right they get a slap or a kick. In most cases it is the boss' fault on account of his not knowing their language. A man going into the mines of Korea must not think he is going to have much pleasure. He will often wish for a well-cooked meal. There is always pestilence of some kind in the country. Smallpox is always prevalent, men going around with the sores just healing.

The mines are easily kept up; stull timbering is all that is necessary. The walls being good, the mines are not very wet. The ore is rich from the surface, miners' wages cheap and transportation cost not great. In Korea and northern China ore can be mined cheaper than in any other country in the world. There is a fine opening for capitalists, but not for prospectors.

The natives do not know how to use firearms, for they have none. They were a warlike people many hundred years ago. Their cities are all walled and show great military skill at the time of construction. Now they are most peaceable and take readily to American customs and are quick to learn. Of all Asiatics, the Korean seems to me to be the best. The country is little known, but in a few years its great mineral wealth will open it up.

Near Pyeng an English company is operating rich gold mines on a large scale. A Japanese company also has a valuable concession. There are copper mines on the east coast.

Jackson, Cal.

THERE is hardly an operation which takes place, in the process of which electricity is not generated in some form or other. A belt running over a pulley—say, driving a dynamo or any other machine—generates electricity as well as heat and sound. In dry and dusty factories, as is well known, sparks of considerable magnitude may often be taken either from the pulley or the belt. All this reduces the efficiency of the transmission, or distribution plant. Every flap of the belt, every unit of electric-

ity, every unit of heat, and every unit of sound generated by a moving belt has to be provided by the driving apparatus, over and above the energy required to drive the machine it is turning, whatever that may be; therefore everything that can be done to reduce these generations, these losses as they are with reference to the work in hand, increases the efficiency of the plant and reduces the fuel bill and other working costs.

Buffalo Hump, Idaho.

Written for the MINING AND SCIENTIFIC PRESS.

The region lying west of the Bitter Root range, which forms the present boundary between Montana and Idaho and stretches from the watersheds of the Salmon river northward to the Cœur d'Alene mountains, was the scene in the early months of 1861 of the first and greatest gold excitement in the North-western country. The stampede has had no rival in the history of mining since the days of '49 (in California), and in some sections even the experience of the argonauts was surpassed. Fortunes were washed out in a single season, and the old Idaho camps of Pierce City, Oro Fino, Florence, Elk City, Dixie and Warrens have produced hundreds of millions in placer gold. The country is drained by the Clearwater and Salmon rivers, and is a wilderness covering an area of 10,000 square miles of high, craggy mountains, flat plateaus, low-lying meadows and deep gorges.

Buffalo Hump rises as a great sentinel, resembling the hump of a buffalo; it can be seen for a distance of 150 miles and forms the dividing hog-back of the watersheds of the Salmon and Clearwater rivers.

The discovery of gold in the Big Buffalo district was made in August, 1898; a rush ensued and by the time snow fell there were 200 locations. The first discovery was made on the east slope of Buffalo Hump mountain, 1000 feet below its summit, and subsequent explorations have proven that the Big Buffalo claim is on the west vein of the mineral belt and midway between its north and south terminations.

The rocks of the district are metamorphic and igneous and are composed of schists, gneiss, coarse-grained granular marbles, coarse hornblende and a mixture of hornblende. Iron, garnet and epidote are found in stringers and irregular lenses. Through these rocks the granite, which forms enormous areas, sent a maze of intersecting dikes and fragments of older rock in great abundance as medium grained. The mineral belt is 2 miles wide and of unknown length. The veins, of which there are four, strike north and south, cutting the granites and metamorphics and dipping east. Over 900 claims were located in this belt previous to January 1, 1900. The attraction to parties for the first time visiting this section is its surface showing—a continuous outcrop all over the Buffalo Hump district, and many of the leads show good assays. The showing on the Big Buffalo, St. Louis, Mother Lode No. 2, Jumbo, Fortune, Vesuvius, Spokane, Monte Cristo, San Francisco and several others on the line of "Mineral hill" promises a future for Buffalo Hump equal to the camps of Rossland and Leadville.

The Big Buffalo ledge is opened by a shaft 200 feet deep, with three crosscuts and a drift 150 feet north and south. The ledge is from 6 to 30 feet wide, and its value right through averages \$8.50. The St. Louis shows a face of 5 feet of ore averaging \$75. The Mother Lode No. 2 shows 22 feet of ledge, 15 feet of which sampled \$12.60. The Jumbo has 5 feet of \$20 ore, and nearly every developed vein upon the line of these claims can show improvement at depth. The mill runs on the Big Buffalo ore, taken merely for testing purposes with an ordinary free-milling gold plant, stamps and copper plates, saves 94% of the assay values. The tailings carry only 60 cents to the ton. The concentrates are handled by Wilfley tables and long canvas plant (as is in familiar use in California). The Vesuvius concentrates carry \$140 to the ton and the cost of carriage and treatment at the smelters will be \$35. The Big Buffalo concentrates run \$56 in gold, \$15 in silver and slight values in copper and lead.

Buffalo Hump camp is eighteen months old. To reach it trails were hewn into the wilderness. Today it has three towns, two postoffices, general stores, hotels and several hundred workmen, besides the finest road in Idaho county connects it with one of the most fertile prairies on the continent. The Northern Pacific Railroad has pushed into Stuart and has surveys almost within the borders of the camp.

Thirty-Ounce Ore.

TO THE EDITOR:—A statement in your issue of the 19th inst. in reference to this company's doings is somewhat misleading in one important respect. The 50-stamp mill is running on thirty-ounce silver ore (not twenty ounce) and is likely to continue to do so. The favorable solution of the problem of the successful and economical treatment of the twenty-ounce ore will make valuable large quantities of that grade existing both in the mine and dump.

JAS. MONTGOMERY, Gen'l Mgr.

Chinipas, Chihuahua, Mexico, Jan. 31.

Electric Fire Hose Signals.*

Every second of time gained at the beginning of a battle against fire is worth an hour later on. Elimination of delay has been the prime object of recent improvements in methods and apparatus. The electrical alarm gives prompt notice of the outbreak of the fire, and a few seconds after the sounding of the alarm the entire apparatus is rushing toward the scene of operations. On reaching there the hose is reeled off from the carriage in a moment, hydrant couplings are made, and the engineer stands ready to force one or two streams of water into the area of fire. Here the first serious delay is apt to occur. The hosemen drag their empty hose up stairs and then have to send a man back to the engine, or the water is turned on as they enter the building, and they are obliged to drag the hose loaded to a point where they can play. Possibly directions may be shouted, but in the noise and confusion of the street may not be heard, or may be misunderstood, and valuable time lost.

It is to prevent this loss that the electric hose signal has been invented and perfected. By means of this device the man who handles the nozzle is constantly in communication with the engineer. The moment he comes within range of the fire he needs

Nozzle Used Between Play Pipe and Hose, Showing Press Button.

Engine Couplings (2½ in. x 2½ in. and 3 in. x 2½ in.) Equipped for Electricity and Wired to Battery and Bell on Engine.

only to press an electric button on the nozzle point, and the answer will be a full stream of water speeding through the hose as rapidly as steam or natural pressure can send it. Should the flames extend upward, necessitating a change of position, the man at the nozzle signals the engineer to shut off his power and empty the line. This is accomplished in a few seconds. The hosemen with empty hose run up to the next flight, signal again for water, and renew their battle with the fire. Not only valuable time is saved in this way, and at a critical stage in the operation when time is precious, but there is saving in labor.

With a proper code of signals any kind of information can be communicated directly from the play pipe to the engineer. When the fire is subdued, and there is no more need of water, the engineer is notified and the supply is shut off. The electrically equipped hose prevents unnecessary flow of water when the fire is out, and minimizes the liability of bursting the hose by the sudden back pressure caused by the operation of other devices for shutting off the stream.

The equipment consists of a small dry battery and bell on the engine, generally placed under the driver's seat, wired to the engine couplings, which are arranged for electrical conductivity. There are also two nozzles with press buttons, to go between the end of the hose line and the play pipes.

For mills and mines provided with their own fire pumps and fire apparatus the electric hose signal is of value. It is furnished by the National Electric Hose Signal Co., 38 Chardon street, Boston, Mass., and on the Pacific coast by the Bowers Rubber Co., San Francisco.

*See Illustrations Front Page.

A 24-Horse Freight Team.*

The two engravings on the front page furnish a scene familiar to many a miner in this west half of America. They represent a team of twenty-four horses at Sumpter, Baker Co., Oregon, hauling a Sederholm boiler to the Red Boy mine. There are nine span, eighteen horses, in front and three teams hitched to a push pole behind. Probably were the roads better there would not be so many horses required. On good mountain roads there are some great records of freighting. The writer recalls a load weighing fifty-two tons that swung out of Hamilton, White Pine Co., Nevada, in 1870, drawn by twenty-four mules. The photos from which the engravings were made were furnished by Mr. W. B. Kehoe, of Spokane, Wash.

*See illustrations front page.

Report on the Portland, Colo., Mine.

Fred W. Bradley of California examined the Portland mine at Cripple Creek, Colo., last November and December, and makes report thereon from which the following is taken:

"I began the examination November 5th, with the assistance of a crew of fifteen men for cutting samples. This crew was steadily employed in sampling the most important parts of the developed portion of the mine until Jan. 6th, taking in that time 2600 samples.

"I find that the occurrence of veins and values does not differ so much from that of other gold districts I have visited. That is, as is characteristic of all gold districts with which I am familiar, payable values occur in the veins only in the shape of shoots. But your decided advantage in comparison with other districts is the great number of veins and the very high values carried by their shoots of ore.

"The geological conditions do not differ greatly from the Grass Valley district of California, for instance, where gold mining has now been going on for over fifty years, and has reached a depth of about 2000 feet. To be sure, there is there no evidence of a great volcanic vent, but there is a basin of granite overlaid by eruptive rocks. The whole mass is fissured and fractured as at Cripple Creek, and these fissures have formed the channels along which underground waters have circulated and in which they have deposited their valuable gold contents in the shape of ore shoots. The fissures not only extend in every direction, but continue uninterruptedly from the granite into the overlying rock, as they do in the Cripple Creek district. Until recent years, miners of the Grass Valley district were afraid of the granite, thinking that payable values occurred only in the surface rocks; but now some of the richest ore bodies ever found in the district are being worked from the veins in the granite.

"So with the Silver City district, Idaho. A network of veins there continues uninterruptedly from the granite up into the overlying porphyry. Work for years has been conducted in both formations, and mines are working to-day on ore bodies that have been followed from the porphyry down into the granite.

"The above conditions are illustrated in your own property, where good ore bodies occur both in the granite and in the crater-filling breccia. In fact, the Diamond veins seem to be productive only in the granite.

"In the Cripple Creek district the many dikes of basalt, andesite and phonolite indicate such deep-seated fissuring and fracturing, leaving favorable channels for the circulation of mineral-bearing waters, that we can confidently expect to find ore shoots at much greater depths than have yet been penetrated by any underground workings of the district.

"I estimate from an examination of your records, that the Portland property has, up to the 1st inst., shipped 208,894 tons of ore, the gross yield of which has an average of \$51.32 per ton. The profits realized from this ore have averaged \$25.70 per ton, or about 50%."

Treatment of Slimes.

At an Australian company's works near Croydon slimes estimated at 10,000 tons assay 9 dwt. 11 gr. gold, 20 oz. 17 dwt. silver per ton, the same of mercury, and 2% of acid produced by mineral decomposition. To treat this for a maximum gold extraction and at a minimum expense T. D. Kellaway had slimes delivered at the works by a tram line in one-ton trucks, each truck load being tested for acidity, and then, with the requisite quantity of lime to neutralize this acidity, tipped into a hopper, thence fed into a disintegrator, thence falling to an elevator, which conveys the disintegrated mud to another hopper for distribution to the mixing vats. A screen interposed between the elevator delivery and the hopper prevents scraps of iron, leather, wood and stone from entering the vats and choking the pumps. The mixing vats, four in number, are 18 feet in diameter by 6 feet deep, with a holding capacity of 10,000 gallons, each vat being supplied with a 4-inch centrifugal pump, which runs at a speed equal to giving a pressure of 45 feet head of water. The suction and delivery are both in the vat. The delivery is supplied with a swivel bend, by which the current is directed to any part of the vat, insuring complete agitation of the slimes in the solution. The pulverized and neutralized slimes are fed in a shower directly over the delivery current and carried immediately into suspension. When twelve tons of slimes have been fed into the vat the agitation presently ceases, the slimes are allowed to settle, and the super-clear liquor is conveyed by decanting pipes, which can be lowered or raised at will, to the extractors. When all the liquor has been run off the vat is refilled with a weak solution and the contents reagituated. Another centrifugal pump is then set in motion, which takes the contents of the vat through a system of piping which connects with the bottom of each vat, and delivers it to another vat, where it is again allowed to settle, the clear liquor being again decanted and run through the weak extractors. Suf-

cient water is now run on the stuff to make up for the strong solution absorbed by the slimes in the first instance. The stuff is agitated a third time, and finally pumped to another vat, where it is once more allowed to settle. The clear water is then decanted and the residues sluiced away.

In this manner twenty-four tons of slimes per day are being treated under Mr. Kellaway's supervision. An assay sample is taken from every ton of slimes brought to the works, and a sample also taken from each residue vat. The gold extraction for December, 1900—1148 oz. 15 dwt. bullion from 572 tons slimes—amounted to 86%, the silver being somewhat less. The amount of bullion is stated to have been within 7d. per ton of the month's laboratory extraction assay of £1 13s. 9d. per ton.

Mining and Metallurgical Patents.

Patents Issued February 12, 1901.

Crushing Rolls.—No. 667,777; F. M. Her, Denver, Colo.

Combination with bedplate, of rolls, pillow blocks in which rolls are journaled, supporting links pivotally connected at upper extremities with pillow blocks, plate with which links are connected at lower extremities, having portion of its under surface curved to conform to arc of circle struck from center of roll, suitable support for plate upon which correspondingly curved faces are formed, suitable means for adjusting plate, comprising set bolts threaded in plate, stationary stops against which inner extremities of bolts bear.

Drill.—No. 668,137; P. M. Bradley and P. F. Stonehouse, Cripple Creek, Colo.

A perforated cross-bar provided with arm projecting from side of center thereof, perforation being screw-threaded, one arm provided with bolt, other depressed and perforated, bolt through perforation, nut of which is above depressed portion thereof, leg detachably secured to each end of cross-bar, chain secured to one arm and to the bolt in the other one, exteriorly screw-threaded sleeve through perforation in bar, upper end with ratchet-wheel, shank through sleeve, lower end adapted to hold drill, upper end adapted to receive means for rotating it, lever pivotally mounted on shank, provided with pawl for engaging ratchet-wheel.

Assaying Device.—No. 667,969; A. Campbell, Surf, Cal.

A bottle shaped receiver having oval outlet opening, removable closure for outlet opening, riffles on

inner side of one of the walls, magnifying glass in opposite side wall of device, closure for opening in wall having riffles.

Safety Cage Chair.—No. 667,780; M. W. Jelinek, Black Hawk, Colo.

Combination with cage, of dogs movably mounted thereon arranged to support cage at various drifts or levels, dogs when in cage supporting position, lying in plane of cage floor and bottom of drift or tunnel, whereby dogs form guides to facilitate running of car from drift to its position on cage.

Elevating and Conveying Apparatus.—No. 667,975; J. M. Dodge, Philadelphia, Pa., assignor to Link Belt Engineering Co.

The combination in elevating conveyor, of single longitudinal chain, carrying wheels mounted thereon, rails adapted to guide wheels, buckets, each having bearings adapted to encircle single link of chain, wheel on opposite side of bucket from bearings, guiding rails engaging with wheel, curved on elevating run so as to turn bucket from one side of chain to opposite side.

Rock Drilling Machinery.—No. 667,664; R. L. Ambrose, Tarrytown, N. Y., assignor to the Rand Drill Co., New York, N. Y.

Combination with cylinder, cylinder head and ratchet box having screw-threaded orifice 10 therein, feed screw, of adjustable feed nut 8 having two sections 9 and 12, section 9 fitted to screw-threaded orifice 10, rigidly secured in position by screwing same up to shoulder, adjustable section 12 also mounted in same orifice, having a locking nut 14 for securing it against movement in either direction in such position, relatively to stationary section 9, to which it may have been adjusted.

Diamond Drill Prospecting.

T. R. Beacon gives the results of his experience in prospecting with the diamond drill, saying three different kinds of drills are made, one being hydraulic feed, its thrust produced by hydraulic pressure; one having positive feed, being forced forward a given distance in a given number of turns, which ration may be altered to some extent; and one having spring feed, its thrust being given by a spiral spring, and which may be increased or diminished by tightening or loosening the nut that compresses the spring.

As to the method of applying the drill in prospecting, assuming a showing on the surface that seems to some extent promising and yet where one is not sure whether there is any extent of vein or whether it holds out in depth, but wanting to find out at the least cost of money and in the shortest possible time, in a district or locality where there has been considerable surface disturbance and in a position to be certain of the nature of the deposit. To sink a shaft to a depth of 100 feet would cost \$3000, and the time consumed would be four months. If the property turns out good then the shaft is all right, but if not we are out the \$3000. With the same amount of money ten holes might have been bored with a diamond drill to the same depth at intervals of say 10 feet apart along the strike of the vein and the vein sampled for a length of 100 feet, and the work done in two and a half months. But as the holes are seldom bored in the plane of the vein the machine placed on the vein at a distance of say 100 feet or so to one side, and the hole bored at such an angle as to cut the vein at a given depth, we have the additional advantage of crosscutting the country for a considerable distance on each side of the vein, and encountering and locating any parallel veins which may exist, or finding our own vein should any slip or

fault have occurred in it. In addition we have a clean, neat, continuous sample of ore across our vein from wall to wall at the point where it is cut, and also samples of the wall rock, and from these can be learned a great deal of what we may expect to find when mining is begun. If the ground is seamy and the rock is very schistose the core will be broken up into small pieces, and this would indicate that the ground is leaky and we may have trouble in our mine, consequently when buying our first machinery we will provide sufficient boiler capacity and a pump of good size to handle the water. On the other hand, the core may come out in long, solid pieces and the hole may hold the water from the drill all the way down, and this will be a good indication that we will have a dry shaft. I found this to be the case in sinking a shaft to a depth of 150 feet, 80 feet below the level of the lake, which was only 200 yards distant, and the shaft was quite dry. Of course it will be remembered these are only indications.

One disadvantage of the diamond drill is that it does not at one hole show any considerable area of the cross section of the vein, and this is often urged against its use, as it is said you may hit the vein at a particularly rich spot or at a particularly poor spot, or you may hit it where the vein may have suddenly narrowed in or widened out, and thus get a totally false conception of the value or size of the vein, and that a few feet either way would show quite a different result. This is quite true, but the way to overcome that is to bore a number of holes from the same point, one below the other; this will test its width at various depths, and then bore a series of holes along the strike of the vein, and in this way a great area of the vein may be sampled very cheaply and in a short time, or a few holes may show from the nature of the vein matter that the deposit is of no value and money may be saved by not developing it. In the case of prospecting and locating ore bodies of minerals which do not occur in veins, but in irregular massive deposits, such as iron or nickel, the diamond drill is extensively used; in fact, for the determination and the extent of these particular kinds of mineral bodies they are almost exclusively used in many sections in preference to shaft sinking.

California Quicksilver Mines.

TO THE EDITOR:—I send you herewith a condensed statement for 1900 of four of the principal quicksilver mines in this State of which I am general superintendent, thinking they may be of interest to your readers:

NAPA CONSOLIDATED QUICKSILVER MINING CO., NAPA COUNTY.	
Total cash disbursements.....	\$162,946.64
Tons of ore mined and treated.....	30,784
Flasks of quicksilver produced.....	4,550
Average yield.....	.566
Cost per ton of mining ore.....	\$2.99
“ “ “ “ inc. develop't work.....	\$3.80
“ “ “ “ ore reduction.....	.63
Tunnels, drifts and winzes excavated, feet....	10,170
Average cost per foot.....	\$2.47
ETNA CONSOLIDATED QUICKSILVER MINING CO., NAPA COUNTY.	
Total cash disbursements.....	\$61,078.29
Tons of ore mined and treated.....	11,888
Flasks of quicksilver produced.....	1,945
Average yield.....	.625
Cost per ton of mining ore.....	\$2.74
“ “ “ “ ore reduction.....	\$1.04
Tunnels, drifts and winzes excavated, feet....	2,052
BOSTON QUICKSILVER MINING CO., NAPA COUNTY.	
Total cash disbursements.....	\$76,052.69
Tons of ore mined and treated.....	6,718
Flasks of quicksilver produced.....	816
Average yield.....	.41
Cost per ton of mining ore.....	\$2.72
“ “ “ “ inc. develop't work.....	\$5.36
“ “ “ “ ore reduction.....	.89
Old working opened and retimbered, feet.....	2,388
New shafts, drifts and winzes, feet.....	1,778
NEW IDRIA QUICKSILVER MINING CO., SAN BENITO COUNTY.	
Total cash disbursements.....	\$113,330.72
Tons of ore mined and treated.....	20,638
Flasks of quicksilver produced.....	3,990
Average yield.....	.74
Cost per ton of mining ore.....	\$3.36
“ “ “ “ ore reduction.....	.68
Tunnels, drifts and winzes excavated, feet....	2,067

At the Boston mine our energies have been directed towards opening up the property and equipping it with a modern plant. A new 60-ton furnace is about completed with new hoisting and tramway machinery, to handle quite extensive ore bodies opened up.

B. M. NEWCOMB, General Supt.
Oat Hill, Cal., Feb. 18.

An Unusual Ore.

TO THE EDITOR:—I notice valuable suggestions in your paper. I am interested in a mine in this State which contains fahlore or fahlerz ore. So far we have been unable to obtain a proper mode of treatment of this product. I thought possibly through your columns that I might obtain from some one of the subscribers a proper treatment of this class of ore. I would therefore invite a solution of this difficulty.

Denver, Colo.

C. R. C.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ARIZONA.

COCONINO COUNTY.

The Eastern Star and Copper King mines, near Flagstaff, are being negotiated for by Eastern men.

COCHISE COUNTY.

The Lake Superior & Western Development Co., Supt. Graham, will sink a triple compartment shaft to the 500-foot level on the Martin Costello group, near Bisbee. The Spray shaft on the Copper Queen, near Bisbee, is down nearly 1000 feet. New hoisting machinery for the Copper Crown, at Fairbank, is going in.

The new 80-stamp mill at the Commonwealth at Pearce is running steadily. One hundred and thirty men are employed.

GILA COUNTY.

Ore from the Ray group, at Ray, near Globe, first passes through a 400-ton-per-day Gates crusher, and is then carried over the 30-inch-gauge railway to the concentrating mill at Kelvin, $\frac{1}{2}$ miles below, on the Gila river; mill has a capacity of 250 tons of ore per day and is fitted with Cornish rolls, 12 iron jigs, 2 Chilean mills of 85 tons capacity each for crushing tailings from the jigs, 20 Hallett tables and a tube mill; latter is an iron cylinder 12 feet long and 4 feet in diameter, half filled with Norway flint pebbles ranging in size from about $\frac{1}{4}$ inch to 2 inch mesh; middlings from the tables are conveyed to the tube mill by a sand pump, are ground to about 60 mesh, and then returned to the tables, where all values are extracted; power is supplied by gasoline engines of aggregate 400 H. P. The Pinal Copper Co., which recently bought the Black copper mines, 8 miles west of Globe, will put in a hoist; sinking of a shaft is in progress; Supt., P. Howle.

Work is under way on the Bradley group, near Globe. Owing to lack of patronage the Globe sampling works have closed down.

GRAHAM COUNTY.

The Arizona Copper Co. is shipping 1000 tons of black copper from its works at Clifton per month. A concentrator, with a capacity of 500 tons of ore per day, is going up at the foot of the Longfellow incline, in Chase canyon. A foundry is also being built above the Clifton works. The Detroit Copper Co. will run a 1500-foot tunnel near Morenci. A 10-stamp mill will go in on the Homestake group, on the San Francisco river, above Clifton.

A body of good copper ore is reported found in the Harrisburg, in Black Rock district, at a depth of 100 feet; O'Neal, Jones & Woon, owners; work is being pushed and shipments of ore will soon be made. Supt. Knowles, of the Lone Star group, in Lone Star district, 9 miles northeast of Safford, reports finding a body of good ore recently.

MOHAVE COUNTY.

The Philadelphia & Arizona M. Co. is pushing work on the Minnesota-Connor mines, at Chloride, with good results.

Work is progressing favorably at the Ben Butler, in Aubrey district. A vein of good milling ore is reported struck in the Lolita shaft, near the Ben Butler; ore will be packed out to the Tremain mill, at Aubrey.

MARICOPA COUNTY.

The Acme Smelting & Ref. Co. project a custom smelting plant and reduction works at Wickenburg. G. E. Lamb, of Clinton, Iowa; B. O. Hatfield, of Pony, Montana, and G. B. Upton are opening a copper and gold property near Wickenburg, sinking and crosscutting. Surface croppings show dyke to be from 60 to 100 feet in width.

Wickenburg, Feb. 13.

The first smelter ever erected in Phoenix was started up recently for a test run. Everything worked successfully.

SANTA CRUZ COUNTY.

The Melzer M. Co., operating the Copete, near San Miguel, has received a traction engine and six wagons, and it will begin freighting coke, bullion, etc., between the mine and Carbo.

YAVAPAI COUNTY.

Near Mayer, Supt. Haggott reports progress made at the Blue Bell. Work on the Scoyoc, near Mayer, is suspended temporarily owing to snow and rain. The tunnel on the Copper Queen will be extended another 100 feet. Good progress is being made in sinking the main shaft on the Copper Ash; a ledge of good ore was recently opened up at a depth of 115 feet; ore carries gold, silver and copper. Supt. Kingsley is pushing work near Huron; fifteen men are employed. The shaft on the Iron King, near Mayer, is down 105 feet; the crosscut at

that depth is in 95 feet; good ore is being taken out. The Golden Cop. Realty Co. is pushing work on its property, southwest of Mayer. Good copper ore is coming out of the shaft on the Cypress, near Mayer, now down 210 feet. High-grade gold ore from the Henrietta is being piled up at the mill for a run. The Yavapai Cop. Co., owning twenty-five claims in the Black Hills, near Prescott, will build a smelter on the edge of Agua Fria valley, and will put in a spur from same to the P. & E. railroad. The National Finance M. Co., operating the White Horse group, on Lynx creek, in Walker district, are making preparations to erect a 10-stamp mill on the property this spring. The Lincoln M. & M. Co. (now being organized) will take over the Lincoln group, near Jerome, and develop same; a 3-stamp mill will go in, stamps to weigh 1000 pounds each, and to drop 120 times per minute. Work on the new railroad between Jerome and Williams will begin soon. The tunnel on the Verde Chief, in Black canyon, now in 200 feet, will be driven an additional 200 feet; two shifts are employed.

CALIFORNIA.

AMADOR COUNTY.

At Amador City the drift from the east shaft to cut the lower levels of the present workings of the Kennedy is driven over 200 feet from the shaft. The drifts in the old works of the Bunker Hill, near Amador City, will be cleaned out and straightened up. The shaft on the Peerless is down 660 feet. At the Kirkwood the shaft is down 270 feet; sinking will be continued. The Moon G. M. Co. will begin work on its copper properties in Camp Opra district.

Supt. C. C. Derby has the shaft at the Oneida, near Amador City, down nearly 2000 feet. One hundred and twenty men are employed in the mine and mill. Sulphurets are being shipped. A new saw mill is going up. A new level will be run at the South Spring Hill, near Amador City. More men will be put on.

BUTTE COUNTY.

There are nine dredgers in operation on the Feather river, south of Oroville; each one employs about seven men, and operating expenses are about \$1000 each per month. The Hesperian Crude Oil Co. and the Grand Chico Oil Co. are organized to bore for oil near Chico.

CALAVERAS COUNTY.

Work is resumed on the French Hill tunnel, near Mokelumne Hill; Supt., T. McSorley. The machinery from the old Union mill, near Lower Placitas, is going in on the Sugar Pine, near Murphys. The San Justin, near Angels, is flooded with water, an explosion of a charge of dynamite having opened up a subterranean river; it will be several weeks before operations are resumed. The Mead G. M. Co. will sink a main shaft on its property, near Rich Gulch. Work is started on the Buffalo (gravel), formerly known as the Starlight, in Chili Gulch, near Mokelumne Hill; a new mill will soon go in; a new hoist is in, and is being run under a 300-foot head of water to unwater the mine; C. A. Werle, owner and manager; drifts east and west to crosscut the Blue Lead Channel will be run. At Murphys, operations on the Ozark are going ahead satisfactorily; a clean-up will probably be made soon. Good ore is reported being taken out at the Big Horn, on San Domingo. The compressor at the May Day broke down last week, occasioning a temporary suspension of operations; work is now under way. Work is progressing satisfactorily at the Sugar Pine, near Murphys. At Sheep Ranch, development operations are suspended; pumps are working, however. Good ore is reported opened up in the Angels, at Angels. Extensive developments are projected for the Oriole, at Angels. The ledge recently struck in the Modoc, in Pioneer district, is improving with development.

The Calaveras Group, the Right and Left Bowers, the Washington, the Fenian and the Fricot, near Murphys, are lying idle. J. Heinsdorff is overhauling and repairing his mill, preparatory for a continuous run when the weather will permit the hauling of ores from his properties near Murphys; ore from latter runs from \$8 to \$12 to the ton. The Duchess will ship ore to J. Heinsdorff's mill for a test. The tunnel in the Delay is in 2000 feet; a strike is reported. Work is in progress on the Union (copper), near Angels. An air compressor and new pipe were recently put in at the Schmedke. Good progress is being made at the Melones, at Robinson's Ferry. At the Cross the air chamber on the 26-inch water pipe leading to the shaft is in and working satisfactorily. Work at the Tullock is suspended pending return of Supt. Guffey. New machinery is going in at the Lockwood, at Mokelumne Hill. The machinery from the Belden, in Ama-

dor county, is being put up near Railroad Flat.

EL DORADO COUNTY.

Work is progressing at the Starlight at El Dorado; L. M. Davis, foreman.

INYO COUNTY.

Owing to heavy snow, mining operations near Darwin are temporarily suspended.

The 20-stamp mill at Castle Peak will start up this spring. Mining operations near Lundy are under way, and it is expected that the 20-stamp mill near there will start up soon. Wood is selling at from \$11 to \$14 per cord.

KERN COUNTY.

The Silver King Oil Co., operating in the Kern river field, will begin drilling for oil. The Globe Oil Co., operating in same field, struck oil sand at a depth of 460 feet five days after the drill was started on its No. 5 well; General Manager McQuigg.

The Occidental-Sonora Oil Co., capital \$5000, is organized at Sonora, to develop 200 acres oil land in the McKittrick, Midway and Sunset districts.

LOS ANGELES COUNTY.

The Alleghany Oil Co. is drilling its first well on its property, near Melrose and Vermont avenues, Los Angeles. The Hecla Oil Co. is putting in a rig on its 10-acre tract on Rosedale avenue.

MADERA COUNTY.

The California Copper Co. has made arrangements to sink the main shaft at the Ne Plus Ultra mine to a depth of 750 feet. Operations on the We've Got It, at Grub Gulch, will begin soon.

MARIPOSA COUNTY.

What is reported to have been the first cleanup in thirty-five years at the Mariposa mill, at Mariposa, was made last week; mill started December 26, 1900; crushed 1600 tons ore, yielding \$16,000 in bullion.

NEVADA COUNTY.

The old Mistletoe, now known as the Canfield, at Rough and Ready, is being put in shape for a run; new hoisting and pumping plants will go in. The Providence, at Nevada City, is now being worked under the tribute system.

ORANGE COUNTY.

The Brea Canyon Oil Co. has completed its pipe line to Fullerton. The Olinda Oil Co. is drilling its third and fourth wells; wells Nos. 1 and 2 are abandoned.

PLACER COUNTY.

The Central G. M. Co., capital \$100,000, is incorporated at Dutch Flat.

PLUMAS COUNTY.

Operations at the Plumas Imperial, near Quincy, will start up next month; a debris dam was built at the Plumas Imperial No. 2 last fall; C. D. Hazzard, Supt. and owner. At the Four Hills, near Johnsville, work underground is in progress. The Bushman gravel mine, near Quincy, which was recently sold to C. D. Hazzard, is under development; Mr. Hazzard will put on more men in the spring and will push work on a larger scale.

RIVERSIDE COUNTY.

Good reports come from the Red Cloud, 30 miles from Salton; fifty men are employed; the 100-ton smelter and the two 10-stamp mills are completed and will start up shortly; mills will handle 300 tons of ore per day at an estimated cost of 65 cents per ton.

SAN DIEGO COUNTY.

Operations at the Monarch and Victory oil wells, near San Diego, are suspended temporarily. Ore running 25% copper is reported opened up on property 25 miles from De Luz.

Suit is begun in the Superior Court of the county to recover one-half interest in the Litzolite, near Pala, containing extensive bodies of lithia-bearing rock; J. Stewart, plaintiff; N. C. Douglas, defendant.

SAN JOAQUIN COUNTY.

A cement works, with an output of between 300 and 600 barrels cement per day, will be built at Stockton.

SANTA BARBARA COUNTY.

The St. Anthony Oil Co. is drilling for oil on the beach, at Santa Barbara; the drill will go down 1500 feet if necessary. The Western Union Oil Co., operating near Santa Barbara, has struck oil at a depth of 2000 feet; twenty-five barrels of oil are now being taken out, and oil has risen 300 feet in the well; oil is about a twenty-five gravity product.

SHASTA COUNTY.

The Black Bear, on Salmon creek, is reported sold for \$200,000 to Eastern men.

The town of Harrison Gulch was partially destroyed by fire on the 17th instant. Redding hears that the Balaklala M. Co. will construct a railroad from the mine to the S. P. main line and erect a smelter with 1000 tons capacity.

SIERRA COUNTY.

The group of placer claims on Chaparral hill, near Downville, is sold to the Hilo M. Co., for \$4000; a 500-foot tunnel is to be run on the property, repairs and new additions will be made to buildings, machinery, etc., and work pushed. The Buckhorn, near Longfellow, is closed down temporarily. Mining operations near Brandy City are suspended temporarily, owing to severe weather.

SISKIYOU COUNTY.

The Fernandez M. Co., operating at Cherry Creek, is stripping its ground by means of blasting; it is thought the claim will produce \$20,000 this season. The new mill at the Dewey, Gazelle district, is nearly completed. The Siskiyou hydraulic placer at South Fork, E. Boyer general Supt., is closed down, owing to freezing weather.

TUOLUMNE COUNTY.

At the New Era, near Sonora, stoping is in progress on the 100-foot level. An eighty-light dynamo is going in at the Black Oak. The new 10-stamp mill for the Dulek is in and running satisfactorily. A 2-foot vein of solid quartz is reported found between Groveland and the Slap Jack by W. Coyle; development work will be started immediately. Supt. Holmes of the Mohican M. Co. has men working on the Lilian at Sonora. Work is in progress on the old Street, near Tuttletown; Supt. R. Kinsman. W. Berry has started work on property near Ward's Ferry, 6 miles southeast of Sonora; a shaft is sunk and a drift is run. Forty-two acres of mineral land 2 miles from Ward's Ferry are reported sold to H. J. Dyke, of Oakland; Mr. Dyke already has a 120-foot shaft, a mill and a hoisting plant on the property.

The Worcester, at Carters, has resumed operations. Vansyckel, Carmen & Co. have bonded the Kodak and Morning Star properties and will sink a new shaft. A shoot of rich ore was recently struck on the Mayflower; more men will be put on soon; Supt. Winwood. The Seminole is still idle.

Drifting is in progress on the 500-foot level of the Mazeppa, at Sonora; ore runs about \$9 to the ton; Supt. Moore. A streak of rich ore is reported on the 700-foot level of the Jumper. At the Republican, thirty-five men are working and the mill is running steadily; drifting and crosscutting are under way. The mill at the Longfellow, which temporarily shut down last week owing to a break in the engine piston, is running again; the building of the addition to the mill is delayed owing to stormy weather and bad roads. The old Keltz, at Columbia, may be reopened. Work on the Sitting Bull, on Knights creek, near Columbia, is progressing satisfactorily.

At the Miller & Warner, in Jawbone district, an arrastra is working steadily. The DeBeers M. Co., owning 2000 acres land in Jawbone district, near Groveland, will push work this spring. The Yosemite G. M. Co., operating the Little Gap, Hoffman and Donahue placer claims, near Gravel Range, has closed down operations temporarily; as soon as weather permits, men will be put on and a 6-mile ditch built to the Donahue. Operations on the Laguria, near Groveland, are resumed, and three shifts are now working; Supt. J. M. Meighan is taking out good ore. The Clio mill, at Jacksonville, is running steadily. As soon as lumber arrives on ground, work of putting in additional ten stamps at the Longfellow mill, at Big Oak Flat, will begin. It is reported that the Moody, at Big Oak Flat, will resume this spring under Supt. W. A. Neville. Byrn & Herndon are working the Ophir, at Deer Flat.

VENTURA COUNTY.

The Sobra Vista Oil Co., owning 337.76 acres oil land near Santa Paula, being sections 2, 3 and 11, township 4, range 22, in Ojai valley, is putting in machinery. A new oil company will take over and develop the holdings of the Ferndale Petroleum Oil Co., near Santa Paula. The Home Oil Co. is drilling its No. 1 well on South Mountain, near Santa Paula. Three hundred and twenty acres oil land near Santa Paula are sold to Los Angeles men for \$35,000. The Slocum Oil Co. is drilling its eleventh well. The Santa Paula Home Oil Co. has a well down 700 feet. The Union Oil Co. has abandoned its 1500-foot hole in Adams canyon, owing to casing becoming jammed.

COLORADO.

CHAFFEE COUNTY.

An electric light and power plant is projected at Cascades, in Chalk creek canyon, by the St. Louis, Mo., company now running the deep tunnel into Mt. Princeton, to cost about \$30,000.

CLEAR CREEK COUNTY.

The Silver Age mine and mill, at Idaho Springs, is reported sold to the Colorado & California M. Co. A contract is entered

into by the latter company with the John Owen Co., whereby the former will be able to work its vein through the John Owen. The adit on the Silver Age is in 1500 feet, a new shaft will be sunk at the dividing and line of the Franklin and Silver Age; the latter mill will be overhauled and a new water wheel will be added.

The tunnel of the Empress Tunnel & Development Co., at Empire, is in 3000 feet, a new shaft house will go in, and shaft will be reinforced, the name is changed to the Hartford M. Co.

GLACIUS COUNTY.

At Crystal, the Fargo incline shaft is unwatered and cleaned out and new track is being laid, new machinery at the mouth of the incline will go in soon; A. Fraser, manager.

BLISS COUNTY.

The Duplex M. Co. is pushing work on its property in the Spanish Peaks, near Walsenburg.

LAKE COUNTY.

At the Box group, Breese Hill, Leadville, the boiler power is consolidated into one plant of twelve boilers at No. 3 shaft. In a building 800 feet from the boiler plant is the compressor and dynamo room. Three compressors operate thirty air drills. Two dynamos, having 600 and 800 C. P. capacity, respectively, furnish light for the surface premises and the underground workings. A system of flash-light signals is operated at all stations, and preparations are being made to put in electric bells. A new device has been produced that will act as a chair indicator, and which will be under the observation and control of the hoisting engineer. It will show him at all times whether any station chair in the shaft is open or closed, and will enable him to manipulate it. Two pumps at the 1000 foot station of No. 4 shaft have a capacity of 2000 gallons per minute. At present 800 gallons per minute are being handled. A portion of the present output of 250 to 300 tons per day is hoisted from practically every level from the 200 foot down to the 1000, the levels ranging about 100 feet apart. The underground workings, which aggregate between 10 and 50 miles of shafts, levels, drifts, winzes and upraises, develop the ledge of oxidized ores nearest the surface and exploit the sulphide bodies which are found from the 300 and 400 foot levels downward. The oxidized body approaches a horizontal position, the sulphide zone being more nearly vertical. The Box group is 5 miles east of Leadville and 1500 feet higher. S. W. Mudd is general manager; James H. Hensley, mine superintendent. The Box and Breese Hill locality is reached by a branch of the D. & R. G. railway, which possesses up Big Evans gulch, furnishing shipping facilities to all the mines in that section of the district. Leadville, Colo., Feb. 10.

J. H. Dunn has leased the Mammoth Co.'s group on Breese hill, at Leadville, and will interest Eastern men in the enterprise, put in a plant and sink a shaft. The Big G. M. Co., operating in Lincoln gulch, 7 miles from Leadville, projects a large mill. Manager Guth reports progress at the bank; it is said that up to the present time about \$100,000 have been expended in development. The Greenback is nearly unwatered. Operations at the New Elkhorn are expected to resume by March 1st.

A strike of rich ore is reported made on the 315-foot level of the Ollie Reed, at Leadville; a drift is being run to tap the upper ore.

The Frank, on Printer Boy hill, Leadville, is shipping ore averaging \$7. The old Printer Boy mill, near the Frank, has been remodeled and it is now capable of handling thirty tons of Frank ore per day; O'Mahoney, McKee, Maurer & Taft lessees.

OURAY COUNTY.

The Iowa & Smelter Trust, in the Snedels district, near Ouray, is sold to Cleveland, Ohio, men for \$45,000.

SAGUACHE COUNTY.

Near Crestone the Broken Tree M. Co. is pushing work. It is locally reported that a fifty-ton custom mill will be built in the district by June. The Good Enough group, same district, is reported sold to Cripple Creek men; two shifts will be put on.

The erection of three mills is contemplated at Bonanza this year. Ore recently shipped from the Eagle run about \$80 to the ton.

SAN JUAN COUNTY.

The Hurley tunnel, now being driven into Simpson mountain from the south fork of Cement creek, near Silverton, now in 500 feet, will be driven to Las mountain, 2200 feet from daylight; a fifteen-drill air compressor, a battery of three boilers and an electric light plant are to go in by May 1st.

The Pleece group, in Pleece gulch, near Eureka, is bought by the Pleece G. M. Co.; a crosscut is being run.

SUMMIT COUNTY.

The old Robinson, at Ten Mile, is being operated again; the shaft will be sunk to the 500 foot level.

The Mount Gilvad tunnel, on Ten-mile range, near Pacific Peak, is in 900 feet; the Glen Mohawk tunnel, same locality, is in 700 feet. Good progress is being made in driving the crosscut tunnel on the Laurium, near Breckenridge. The Augusta Juventa M. & M. Co., in driving its long crosscut tunnel to cut the Juventa vein, recently struck a flow of water estimated at 1000 gallons per minute and operations were stopped; Manager Griffith is putting in a Buffalo air exhauster, engine and boiler at the mouth of the tunnel. A 3000-foot tunnel is being driven by the Gold Run M. & M. Co. on Mineral hill.

TELLER COUNTY.

It is reported that W. S. Stratton may buy all properties on Raven hill, near Victor, from Windy Point to and including the Abe Lincoln on the south. Lasson Bell, on the southwest end of the Amanda, is drifting on the 100 foot level. Drifting south on the 100 foot level of the main block of the Mary Ann, on Raven hill, is in progress. Ore running \$30 to the ton is being shipped from the Joe Dandy, on Raven hill. The Economic mill of the Woods Investment Co., is shut down; the Columbine Victor tunnel, at Columbine, connecting the mill with the Gold Coin, now in 2000 feet, will go in an additional 700 feet; the electric locomotive which will haul through this tunnel is on the ground. On the Bonde Nell, the Bonde Nell M. Co. has drifted 35 feet west on the 300-foot level; ore from the 200-foot level is running at about \$15 to the ton. The output of the Gold Coin, Cripple Creek, for the month of January was 3400 tons of ore, most of which came from the 850-foot level; work is also in progress on the 1000-foot level.

A body of good ore is reported on the 275-foot level of the Damon, Cripple Creek. The crosscut on the 400-foot level of the Eclipsa is in 100 feet. Regular shipments of ore are being made at a depth of 450 feet below the tunnel level of the Anconia. A 25 H. P. boiler goes on the Bairman lease on the Woodman of the Merchants Co. At a depth of 165 feet on the Jory Johnson a 2-foot body of ore assaying from \$40 to \$300 to the ton is opened. A new pump will go in at the Morning Glory; daily output of the mill is given as \$6000; ore averages about four ounces gold to the ton.

A body of good ore is opened up at 110 feet in the Sedan at Cripple Creek. In the old Moore, on Raven hill, a vein of good ore is struck at the 156-foot mark in the north drift on the 1050-foot level. The Morning Glory shaft will be unwatered to the 700-foot level, at which point a drift will be run to cut the Doctor 100 feet below the present workings. A crosscut will be run at this depth; sixty-five tons of ore are being shipped daily.

The shaft on the Bob Lee, now down 150 feet, is expected to reach the 300-foot level by April 1st.

IDAHO.

BLAINE COUNTY.

The Tiptop mill, at Halley, is to start up. A larger mill and a hoisting plant will go in on the Croesus mine, near Halley. The Golden Star will start June 1st. It is expected that new mills will go in on the Liberal and Maggie May claims, near Halley, next fall.

LATAH COUNTY.

The Syndicate, on Gold creek, near Kendrick, is sold to Seattle parties, and the name of the property is changed to the Jericho. Two shifts are employed.

NEZ PERCES COUNTY.

Ore from the Apex, in the Dixie section, near Lewiston, runs from \$15 to \$20 gold to the ton; Campbell & Finch of Spokane, Wash., owners.

SHOSHONE COUNTY.

The new concentrator going in at the mouth of Government gulch, 2 miles below Kellogg, for the Empire State Idaho M. & D. Co., is nearing completion. The Hypotheek M. Co., capital \$150,000, is incorporated at Wallace.

The Murray Dev. Co. has three shifts running a tunnel on the Bearport, near Murray; tunnel is going ahead at the rate of 4 feet per day; ledge is expected to be reached by March 15th.

MONTANA.

CASCADE COUNTY.

The Boston & Montana M. Co. will put in two auxiliary steam plants, one of 1500 H. P. and the other of 1000 H. P.—at Great Falls.

MADISON COUNTY.

Pritchett & Pastridge have a renewal of their lease on the Keynote, in Georgia gulch, near Sheridan. A new strike is made on the Toledo, at Brandon, 3 miles east of Sheridan; Manager Lortie.

PARK COUNTY.

About forty tons of ore are being run through the mill daily at the Julien, near Livingston.

NEVADA.

ELKO COUNTY.

Eighteen men are laid off at the Dexter Tuscara, at Tuscara.

HUMBOLDT COUNTY.

A suit, involving possession of the Nelson group, on Jackson creek, near Winnemucca, is begun in the U. S. District Court at Carson; Snow & Co., plaintiffs, J. A. Nelson, defendant.

LINCOLN COUNTY.

Messrs. Evans & Kent have bought all the lead prospects of Messrs. Hybas, Smith & Meyers for \$8000. C. M. Over is shipping another car lot of copper ore.

C. A. Beck is pushing development work on his lead mines, the outcrop of which is corundum, running 70% lead. The vein is 6 feet thick by 20 feet in width.

The California Con. M. & R. Co. will put seventy men to work on the Half Moon mine, near Pioche; Supt. S. Godbs.

There is a heavy snowfall throughout Lincoln county, thus insuring water for the coming summer. Messrs. Smith & Cook have sold five lead claims to Senator Perkins and U. S. Attorney J. H. Call.

Good Springs, Feb. 10.

The January run of the new Horseshoe mill, at Pay, amounted to \$20,000; more tanks will be added to the plant.

A telephone line is being run to the Abe Lincoln group, near Pioche.

LYON COUNTY.

C. S. Batterman of Butte, Mont., and others, operating in Mason valley, near Dayton, will put in a 150-ton smelting plant.

STOREY COUNTY.

On the Con. California & Virginia, at Virginia, the northeasterly drift from the fourth floor. In the winze sunk from the old north drift at a point 70 feet in from its mouth, is in 36 feet; during week ending Feb. 16th four cars (233,500 pounds railroad weight) of ore, of average assay value of \$54.08, were shipped to the Selby Smelting & Lead Works, at San Francisco, Cal. The northwest crosscut from the southwest drift on the 1700-foot level of the Ophir is run 381 feet.

The west crosscut, started at a point 90 feet in from the mouth of north drift No. 2 on Central Tunnel level of the Mexican, is in 303 feet; face in hard porphyry.

The Hale & Norcross tunnel is in 2020 feet. Stopping is still in progress on the first, second, third, fourth and fifth floors of the 325 foot level of the Gould & Curry; 224 tons of ore from the eleventh, twelfth and thirteenth floors of the 425-foot level, recently milled, ran \$10.25 gold to the ton, as per battery sample. The west drift from crosscut No. 9 on the 425-foot level of the Best & Belcher is in 91 feet; face in quartz and porphyry. Surface tunnel No. 2 of the Utah is in 875 feet; face in hard porphyry.

WASHINGTON COUNTY.

Operations on the Crane, east of Steamboat Springs, are resumed.

WHITE PINE COUNTY.

The Chalmers M. Co., at Ely, is putting in new machinery, consisting of two pumps—a sinking and a station pump—400 feet of steam pipe, etc.; sinking pump has a capacity for handling 225 gallons water per minute, and the station pump is capable of throwing water 720 feet; the Pelton wheel will soon arrive from San Francisco, when it will be put in place.

A shaft is being sunk and a crosscut run on the property at Ely recently bought by Shear, Groux, Snedeker and others.

NEW MEXICO.

GRANT COUNTY.

The new concentrating mill at Deming is running successfully. A strike of rich copper ore is reported made on the Notion, near Hanover; Briggs & Doyle, owners. New machinery is going in at the Empire M. Co.'s mill, at Hanover; Manager J. W. Bible. C. Smith, of Silver City, is putting in a 10-stamp mill 6 miles north of Stein's Pass; water will be supplied from Animas valley, 5 miles distant; upon arrival of water pipe latter will go in, and mill will start up on ore from the volcano; Mr. Smith is Supt. and Gen'l Mgr.—Pritter & Crawford, operating on the Santa Rita, at Santa Rita, are taking out shipping ore. The old mill machinery of the Santa Rita Co., which was destroyed by fire some time ago, is being sent to the El Paso, Texas, foundry. A shaft is being sunk on the southern extension of the old San Jose, near Santa Rita.

OREGON.

BAKER COUNTY.

L. G. Wheeler, operating the St. Anthony group, near Sumpter, has run the crosscut tunnel about 600 feet, and has out

four ledges, the average width of which is 207 feet. Work will be pushed, and it is probable that an air compressor and drills will go in in the spring.

JACKSON COUNTY.

A deal is under way whereby A. M. Lowry and others of New York may take over the Keystone and Champion claims on Jackson creek, near Jacksonville. Should the deal go through, a 6-stamp mill will be put in.

JOSEPHINE COUNTY.

Two plants are running constantly at the Wimer & Reames placer mine, at Waldo.

SOUTH DAKOTA.

CUSTER COUNTY.

The Iron Mountain M. Co., operating at Iron Mountain, 12 miles northeast of Custer, is mining ore that carries an average of \$3.25 gold to the ton. The Chicago Mica Co. is shipping mica from the Crown, near Custer, to Valparaiso, Indiana. Operations at the Hardin are under way, unwatering of the Two Hit shaft being nearly completed.

LAURENCE COUNTY.

Work on the new plant of the Dakota M. Co. at Deadwood is under way. The Bolt Development Co. will sink a 600 foot shaft between Kirk and Lead.

Philadelphia and New York men, who recently bought a group of tin-bearing claims, in Bear gulch, near Lead, will project a 150-ton concentrating plant; a railroad will probably be built to the plant.

The Gold Coin M. Co. is organized, and the Deadwood-Bear Gulch Co. is re-organized; both companies will put in steam hoisting plants this spring. The Trent M. Co. has opened a ledge of horn silver ore at Carbonate.

PENNINGTON COUNTY.

Ore from the Cape Nome group, 6 miles north of Rockford, assays 25% manganese and 8% nickel. Ore was recently shipped to Omaha, Neb., for treatment.

UTAH.

BEAVER COUNTY.

The Royal Copper M. Co., capital \$600,000, is incorporated at Salt Lake to work properties in this county; A. P. Lewis, El Paso, is agent of the company for Utah.

BOX ELDER COUNTY.

The tunnel on the Golconda, at Park valley, is in 320 feet.

GRAND COUNTY.

A company is organized to build an electric railroad from Richardson, on the Grand river, to the foot of Miners' basin, 20 miles, ultimately extend the line to the Paradox section, 35 miles further, to bring it into easy reach of the Rio Grande Southern Railroad. Should the line be built, it is said that the Iowa, Corsair, Tornado and Indiana mines will be able to produce 200 tons of ore per day. Another company is organized to build mills and smelters at the river terminal of the line and furnish electric power necessary for the operation of the road.

JUAB COUNTY.

The main shaft on the Eagle & Blue Bell, at Mammoth, is down 380 feet; a drift on this level has opened up a large body of low-grade ore, carrying streaks of high-grade ore; picked samples from the latter gave 120 ounces silver and \$60 in gold to the ton. The Caribee, at Mammoth, is shipping ore running 30% copper. A three-fourths interest in the Missouri Pacific, in Death canyon, near Tintic, is bonded to H. D. McCroskey for eighteen months for \$7500. Work at the Eureka Hill will resume soon. The shaft on the Little Chief, now down 600 feet, will go to the 800-foot level. Good ore bodies are opened up on the 700 and 900-foot levels of the Beck, at Eureka. Shipments of ore from the mines of Tintic during last week were as follows:

	Cars.
Cantonial-Eureka	22
Bullion Beck	4
Gemini	10
May Day	1
Mammoth	16
Godiva	5
Grand Central	3
Lower Mammoth	2
Caribee	4
Tosora	4
Swansea	5
South Swansea	2
Star Con.	7
Undine	1
Total	80

CONCENTRATES.

Mammoth Mill	2
Eureka Hill Mill	1

BULLION.

Mammoth Mill	3

Supt. D. C. Sullivan states that drifting both ways is in progress on the 350-foot

level of the Primrose at Silver City.—A new strike is reported made on the 600-foot level of the Little Chief at Tintic.—More men were recently put on at the La Reine; machine drills will go in by March 1st, it is thought.—At the Bullion-Beck, at Tintic, eighty men are working; work is in progress on the 300-foot level; A. E. Hyde, assistant manager.—Operations at the Grand Central are resumed.

SALT LAKE COUNTY.

Ten cars of copper matte from the new Bingham C. & G. M. Co.'s smelter, at Bingham, recently reduced at Taylor & Brunton's sampler, at Salt Lake, averaged about 16% copper; matte will be treated by the American Smelting Co.—The Nast, at Bingham, is shipping ore.—The Vespasian & Hoogley M. Co., operating a group of claims at the head of Markham gulch, in Bingham district, will extend the tunnel, now in 500 feet, to the 600-foot mark, at which point drifting will be started.

Manager Keel reports the Butterfield mill at Queen tunnel, near Bingham, running O. K.—Work is under way in the Amazon tunnel of the Mystic Shrine group; Manager E. W. Young.—A cross-cut is being run on the Tin Horn.—An engine-bed foundation is being built at the Shawmut powerhouse; a 10 H. P. engine will go in to run a dynamo which will drive three electric drills.—The Fire King at Bingham is sold to the St. Joe M. Co. for \$2500.

WASHINGTON.

FERRY COUNTY.

The shaft on the California will reach the 200-foot level March 1. Stopping is in progress on the 100-foot level. The low-grade ores will be shipped to the Granby smelter at Grand Forks, B. C., and the high-grade ore will be shipped to Trail, B. C. The last shipment sent out, consisting of 11½ tons, returned \$1470.—At the Princess Maud at Republic work is in progress on the 300-foot level, below the tunnel level. The north drift is in over 55 feet and the south drift is in over 35 feet. During the last seven months 200 feet of shaft has been sunk and 200 feet of drifts have been run. One shift is employed; Supt. M. Hodges.—The Republic mill at Republic is receiving custom ore. It is thought that the new auxiliary crushers will be running this week.—A recent smelter test of fifty pounds of ore from the ledge recently opened up on the 150-foot level of the Gold Cord at Keller gave returns of \$69.70 in silver and copper. A 350-foot tunnel is being run to tap the ledge at a depth of 270 feet. The tunnel, now in 80 feet, is progressing at the rate of 6 feet per day (24 hours). A car and track are in the lower tunnel.—Work on the Big Chief, adjoining the Gold Cord, will be resumed shortly. A 100-foot shaft will be sunk.—The tunnel on the Caledonia is in 75 feet. Work is suspended pending a deal with Rossland, parties.

OKANOGAN COUNTY.

The lead on the Copper World, on Palmer mountain, 4 miles from Loomis, is 15 feet wide; the tunnel is in 225 feet, and it has cut the vein at a depth of 100 feet.—The tunnel on the Lakeview, on Mount Ellemeham, now in 265 feet, opened up a body of rich silver ore recently; a cross-cut is being run.—Rich ore is reported being taken out of the Palmer mountain tunnel.

STEVENS COUNTY.

The Gold Standard, Gold Bug, Copper Butte, Silver Tip and Gold Coin, in Pierre Lake district, are reported sold to the Consolidated Gold Bug M. Co. A 110-foot shaft is sunk on the property at a point 150 feet from the line between the Gold Bug and Silver Tip. The ore averages about \$30 to the ton at present depth. A new hoist, Buffalo whim, Knowles sinking pump, feed pump and other machinery are going in, and everything is expected to be in shape to run by March 1; Supt. Harris.

The new furnace at the Northport smelter is about ready to be blown in, and the fifth furnace is expected to be ready within a month, making capacity of smelter 1350 tons.

SPOKANE COUNTY.

The Ohio Oil & Gas Co., capital \$100,000, is incorporated at Spokane.

The Kootenai Copper M. & S. Co., capital \$30,000, is incorporated at Spokane.

WHITMAN COUNTY.

McCoy, Brewster, Conrad & Robinson, operating near Oakesdale, are putting in new drills.

WYOMING.

CARBON COUNTY.

The vein on the Elk, on Elk mountain, near Saratoga, Supt. W. R. Wilcox, is reported to be 100 feet wide; ore assays 20% copper; the Elk Mountain M. & M. Co. is incorporated to work this mine.

FREMONT COUNTY.

At the Carissa at South Pass sinking of

the shaft is in progress. An air compressor is ordered. The mill will probably be enlarged.—Manager J. Boylan is working the Burr, near Lewiston.

FOREIGN.

BRITISH COLUMBIA.

The Consolidated Cariboo Hydraulic M. Co., operating 200 miles from Ashcroft, employs 150 men. The company is now putting in supplies, etc., for six months, besides \$11,000 worth of miscellaneous machinery; Supt. J. B. Hobson.—What is said to be the first heater and purifier for utilizing mine water for steam making purposes in the Boundary district has been put in at the Old Ironsides, near Phoenix. The heater has a capacity of heating water to feed 500 H. P. boilers. In connection with the heater there is a pump capable of feeding 300 H. P. boilers. The process is simple. The mine water is pumped directly into the top of the heater, in which is arranged a pyramid of iron pans, the water dropping from one pan to another, the pans collecting the lime and other impurities. It is said that the heater has already made a saving of nearly one-half of the fuel generally used.

—New furnaces and a converter will go in at the Granby smelter at Grand Forks this year, doubling the capacity of the smelter, enabling it to treat 1200 tons of ore daily; A. B. W. Hodges Supt.—The Kilo and the Chapleau, on Lemon creek, in Slokan district, are to be consolidated. Pending negotiations the mine and mill are closed down. Upon the completion of the deal operations will be resumed.—The Humming Bird, near Greenwood, has resumed shipping ore to the Granby smelter at Grand Forks. Sixty-one tons of ore recently shipped returned an average of .96 ounce gold and 1.5 ounces silver to the ton. The average of previous shipments of 172 tons was \$20.89 per ton. Supt. E. W. Liljegrann reports good results in development.—The Carmi, on the west fork of the Kettle river, is making regular shipments to the pyritic smelter at Grand Forks, it being under contract to ship 2000 tons of ore. The ore is hauled in sleighs to Midway, a distance of 50 miles, and from there it is shipped by rail to its destination.—The Republic group, on Erin mountain, 2 miles from Slokan, is reported sold to C. Dempstu of Rossland.—Work is progressing satisfactorily on the Soho group, in McGuigan basin, near Slokan. The tunnel is 1000 feet long. Supt. J. C. Ryan states that shipments of ore will begin soon. More men will be put on.—The Silver Belt group, on Toby creek, in Windermere district, is showing 4 feet of ore.—A shipment of 16½ tons of ore recently from the Bondholder, near Slokan, to the Nelson smelter returned 235 ounces silver and 6½% lead to the ton. The net receipts from the smelter, after paying freight and treatment charges, were \$2400.—Ore from a depth of 120 feet in the Waterloo at Camp McKinney is said to run from \$19 to \$388 to the ton.—Shipments for 1901 to date of the mines near Slokan are as follows:

	Tons.
Arlington.....	460
Enterprise.....	60
Two Friends.....	40
Black Prince.....	20
Bondholder.....	20
Total.....	600

Following are the ore shipments received at the Trail smelter from different shipping mines for the week ending February 9:

	Tons.
Center Star.....	1,696
War Eagle.....	728
Iron Mask.....	139
Spitzee.....	16
B. C.....	722
Minnesota.....	19
Payne.....	61
Ivanhoe.....	20
Bosun.....	20
Sullivan.....	277
Ymir.....	56
Total.....	3,757

The Tin Cup M. & S. Co. of New York, which recently bought the Tin Cup, in Burnt Basin district, near Gladstone, will push work on the property this spring; G. K. Stocker, general manager, Cascade City.—During the week ending Feb. 16 shipments of ore from Rossland were 5957 tons, as follows:

	Tons.
Le Roi.....	2,364
Center Star.....	2,160
War Eagle.....	1,020
Iron Mask.....	113
Le Roi No. 2.....	200
Velvet.....	100
Total.....	5,957

MEXICO.

A new body of high-grade gold ore is reported opened up in the Creston, at

Minas Prietas, Sonora.—A new electric lighting plant is going in at the Zabiata, near Sonora.—A strike of rich ore is reported made near the Verde, at La Colorado.—At Sahuaripa, the tunnel in the Tegeda has reached the old workings and has drawn off the water; A. C. Wright, Supt.—The deal for the sale of the Dewey and Esmeralda de Dewey mines, near Willard Station, on the Sonora railway, to Eastern men, is closed, price paid being \$100,000.

A. L. Waters, Supt. British G. M. Co., Ltd., states that the smelting plant on its property near Matape, Sonora, is completed and the outlook good.

The Sonora Dev. Co. of Kansas City, Mo., has bought sixty-four acres of copper land near Nacosari, Sonora, besides the extension of the Churunbabi, known as the Conforme, in Montezuma district, Sonora, and others.

NEW ZEALAND.

At Oreville, on Great Barrier island, the Barrier Reefs Co., manager, A. S. Howe, has a 2100-foot tramway running from the lowest level of the mines to the ore bins; latter have a capacity of 1200 tons; No. 3 level is extended 400 feet and No. 1 level is in 600 feet; Gates stone breakers are used; twenty 1100-pound stamps are dropping; vanners in use were supplied by the Union Iron Works of San Francisco, Cal.; cyanide plant consists of two large slime vats, four settlers and three percolating vats; power at the mill is supplied by a 125 H. P. engine; mill is lighted by electricity; 1758 tons of ore recently crushed returned 2090 ounces of bullion, valued at £2024 9s 6d (about \$9859.15), and 59 tons 12 cwt. of concentrates, worth £3552 14s 3d (about \$17,301.65); total, £5577 35s 9d (\$27,160.80).

The last clean-up for 1900 at the Waihi, in the Waihi district, near Auckland, from a crushing of 6394 tons of ore, yielded £20,335 (\$99,031.45). The main shaft in the Grand Junction, same district, is down 600 feet, and drifting will be begun at that depth.—The Waihi Extended shaft is down 200 feet.

Personal.

J. A. CORAM, of Lowell, Mass., is in Salt Lake, Utah.

T. LAIRD is now Supt. the Duchess, Angels, Cal., vice P. Maul.

J. FARRELL, formerly of Tombstone, Ariz., goes to South Africa.

H. F. BROWN has returned to San Francisco from British Columbia.

J. H. BELL is Supt. Bennett mine, Bennett's camp, Sombroero Butte, Ariz.

R. H. POSTLETHWAITE has returned to San Francisco from Shasta Co., Cal.

E. L. REDDING, Asst. Mgr. Duplex M. Co., Walsenburg, Colo., is in Chicago, Ill.

J. T. HAWKINS is now Supt. Comanche Plume Co.'s property, Cripple Creek, Colo.

J. W. DEANE, general manager Yavapai Copper Co., Prescott, Ariz., is in Denver, Colo.

F. THOMAS of the Slap Jack, Jacksonville, Cal., has returned there from San Francisco.

R. H. TERHUNE, Pres. New State Smelting & Refining Co., Salt Lake, Utah, has resigned.

D. R. OLIVER has returned to San Francisco from the Zubiata, near Minas Prietas, Sonora, Mexico.

W. DAVEY, of Philipsburg, Mont., goes to Leadville, Colo., as Supt. of Mines for the New Elkhorn M. Co.

A. B. W. HODGES, Supt. Granby Smelter, Grand Forks, B. C., goes to Chicago, Ill., and from there to Milwaukee, Wis.

SUPT. SILVER of the Zubiata, 15 miles from Minas Prietas, Sonora, Mexico, has resigned and will return to California; S. H. Oliver succeeds him.

Commercial Paragraphs.

THE American Steel & Wire Co. has issued a list of its products, infinite in variety, range and extent of production. The pamphlet may be obtained from any of the company's agencies.

THE Atlas Pipe Wrench Co., of New York and San Francisco, say that the increasing demand has compelled them to increase their facilities, and they are now ready to deliver wrenches in any quantity, and can hereafter promise immediate delivery.

THE Clot & Crist Machine Co.'s new works at 137-139 Beale street, San Francisco, is fully equipped with new modern shop tools and machinery for building and repairing steam engines, pumps, etc. Messrs. Clot & Crist are accounted experts, having had long and varied experience with all kinds of pumping machinery.

Books Received.

The chemistry of the cyanide process is superbly treated in a monograph by Prof. S. B. Christy, Dean of the College of Mining, University of California, Berkeley, Cal., entitled "The Electromotive Force of Metals in Cyanide Solutions," an elaborate and exhaustive treatise, giving the derivation and development of the theory and practice of electro-chemical action pertaining thereto, detailed description of the experimental work on that subject and full account of the methods by which such investigation was conducted. The work has additional value in the diagrams and other illustrations, and adds to the fame of the author, whose former treatises on the same general subject have had so deservedly wide a circulation.

Recently Declared Mining Dividends.

	Payable.
Home M. Co., Colorado, 25 cents per share, \$12,500.....	Feb. 15
Gwin Mine Development Co., California, 10 cents per share, \$10,000; total amount, \$176,500.....	Feb. 19

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR WEEK ENDING FEBRUARY 12, 1901

667,757.—CATTLE GUARD—W. R. Allen, Hoquiam, Wash.
667,758.—NUT LOCK—W. R. Allen, Hoquiam, Wash.
668,081.—LUBRICATOR—P. Bartlett, Spokane, Wash.
668,084.—ANIMAL TRAP—C. C. Bowen, Santa Monica, Cal.
668,085.—ANIMAL TRAP—C. C. Bowen, Santa Monica, Cal.
667,969.—ASSAYING DEVICE—A. Campbell, Surf, Cal.
667,840.—RESPIRATOR—S. Guthrie, S. F.
667,700.—SPIKE—T. J. W. Hicks, Prescott, Ariz.
668,102.—MOP WRINGER—J. H. Johnson, Silverton, Or.
667,943.—CURTAIN HANGERS—E. F. Kaiser, Fresno, Cal.
667,785.—COMPASS—A. Lietz, S. F.
667,786.—COMPOSITION OF MATTER—F. A. Lobert, National City, Cal.
667,923.—CORSET—Lida S. Reed, Bakersfield, Cal.
667,833.—POLE SOCKET—C. Vanarsdall, Enumclaw, Wash.
667,755.—CRATE—W. H. Wright, San Jose, Cal.
667,756.—GAS CUT-OFF—R. Wynnall, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

RESPIRATOR.—No. 667,840. Feb. 12, 1901. Samuel Guthrie, San Francisco, Cal.

The object of this invention is to provide an apparatus which is especially designed for the protection of operatives working in places where they are subject to foul gases, to smoke in case of fires, and generally for protection against asphyxiation from any cause. It consists of a two-part mask, fitting the mouth, nose and eyes of the wearer; an expandable bag carried upon the person, a pipe connecting the bag with the mouth and nose section, a second pipe connecting with the eye section, and means for charging the bag from a distant point.

GAS CUT-OFF.—No. 667,756. Feb. 12, 1901. Robert Wynnall, San Francisco, Cal.

This invention relates to improvements in chandeliers by which certain of the burners may be raised or lowered with relation to the supply pipe, and a tight joint made at the gas inlet into the burner tubes. It consists of a main vertical supply pipe, with one or more parallel tubes supported therefrom, pipes slidable in said tubes and having burners connected therewith, holders at the lower ends of the tubes, and cock-controlled gas connections with the main pipe. There are holes in the slidable pipes, and stops to limit the movement of these pipes, so as to register the holes in them with the openings from the supply pipe. Surfaces are provided fitting the pipes, through which communication to the burners is made, and means for locking the pipe in position.

Latest Market Reports.

SAN FRANCISCO, Feb. 21, 1901.

SILVER.—Per oz., Troy: London, 28½d (standard ounce, 925 fine); New York, bar silver, 61½c (1000 fine); San Francisco, 61½c; Mexican dollars, 50c.

COPPER.—New York: Lake, 1 to 3 casks, \$17.00; carload lots, 16.75; Electrolytic, 1 to 3 casks, 16.75; carload lots, 16.50; Casting, 1 to 3 casks, 16.60; carload lots, 16.35. San Francisco: 18. Mill copper plates, 20c; bars, 22½c.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.20; Missouri lead, \$4.32½ desilverized lead; San Francisco \$5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6½; sheet 7½, bar 6c; pig, \$4.70 @5.10. London, £15 per ton—3.26 cts. per lb.

SPELTER.—New York, \$4.10; St. Louis, \$3.75; London, £17 12s 6d per ton 3.82 cts. per lb; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallott's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13½c; 100-lb lots, 15½c.

IRON.—Pittsburg, Bessemer pig, \$13.50; gray forge, \$13.30; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$21.00; open hearth billets, \$21.50; San Francisco, bar, 70 to 12c per lb.

TIN.—New York, pig, \$26.95; San Francisco, ton lots, 29c; 1000 lbs., 29½c; 500 lbs., 29½c; less, 30c; bar tin, 30c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$48.00 per flask of 76½ lbs.; Export, \$44.50.

MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 70; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 15½c.

ASSAY LITHARGE.—San Francisco, 10c per lb. small lots.

BISMUTH.—New York, per lb., \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 lb lots.

PLATINUM.—San Francisco, crude, \$17 ½ oz.; New York, \$18.20 per Troy oz.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

PHOSPHORUS.—F. o. b. New York 50@60c per lb.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1½, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1½ 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2½ 35%, carload lots, 9½c; less than one ton, 11½c. No. 2½ 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@33½c per lb.; carloads, 30½@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 68% B, 2c per lb.; soda ash, \$1.90 per 100 lbs. 58%; hyposulphite of soda, 25@30c per lb.; blue vitriol, 5½@6½c per lb.; borax, concentrated, 7@8c per lb.; chloride of potash, 12@13c; roll sulphur, 6c; alum, 11.90@12.00; flour sulphur, French, 2½@2½c; California refined, 1½@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., \$1.00; sds, 95c per 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COPPER: Do you know that of \$52,000,000 dividends declared by listed mining companies last year the copper mines paid \$33,600,000? Arizona is the richest copper country on earth and affords the greatest opportunities for the profitable investment of capital. THE ARIZONA SILVER BELT, the leading weekly newspaper, gives the reliable mining news; published at Globe, Arizona; \$2.50 per year. Write for sample copy.

INVENTORS, Take Notice!

L. PETERSON, MODEL MAKER,
644 MISSION STREET, bet. First and Second Sts., SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications strictly confidential.

AUTOMATIC SAMPLING
Mill Plans, Cyanide, Concentration, Smelter.
F. D. BAKER, Mech. Engr., DENVER.

SITUATIONS WANTED.

MINING ENGINEER DESIRES A POSITION AS mine superintendent. Thoroughly competent stamp mill man. References. "M. B. I." this office.

PRACTICAL MINER and TOOL SHARPENER, fifteen years' experience in the United States and British Columbia, would like a position. Address "D." care of this paper.

SITUATION WANTED by a young man who is a practical miner; understands cyanide work and is a good assayer; would like to take charge of small gold and silver mines or assist in a large one. Good references. Address D. W., this office.

WANTED—A position as superintendent for a mining company by a man of 16 years' practical mining experience; understands mining and milling, amalgamation, concentration and leaching; good assayer and accountant; would accept of any subordinate position if good; references. Address "Advertiser," 1225 Webster St., Oakland, Cal.

CHEMIST AND ASSAYER, with experience in drafting, bookkeeping and typewriting, desires position as assayer or assayer and bookkeeper in mine or as secretary to mining engineer or mine official. Has fair literary and scientific education. Experience in the preparation of reports, prospectuses and catalogues. Excellent moral character and good health. For further particulars, address E. K. M., care Mining and Scientific Press.

Miner Engineer, technical graduate, with nine years' practical experience, wishes position as manager or superintendent of a mine or of a milling proposition. Thoroughly competent and reliable. best of references. Understands draughting, buying machinery, erecting, operating. Experience with all chemical processes, cyanide expert. Speaks Spanish, familiar with Mexico, prefer position in the U. S. Address Box 25, this office.

Situation Wanted by Mining Engineer of 20 years' experience in California, Colorado, Mexico and Germany. Has had charge of large properties—gold, silver, lead, copper, sulphur and oil. College graduate; good assayer, surveyor and accountant; speaks Spanish. Has experience in railroad construction and road building. Formerly U. S. deputy mineral surveyor and member of geological field force. Will work anywhere. Address P. M., Mining and Scientific Press.

Position as Superintendent of a gold mine or mill desired by an experienced mining engineer and metallurgist. Competent to take full charge of a gold mine or mill. College graduate. Good assayer, surveyor, etc. Can leave present position on short notice. Salary moderate. Address "B. Sc.," care of this paper.

WE BUY very rich Ores, Dental Scraps, Tellurium Ores, Mill Wastes, Jewelers' Sweeps, Gold Retorts, Old Iron Retorts, Base Amalgam, Quicksilver, Amalgamated Plates, Gold and Silver, Old Slags.

A. M. DONALDSON & CO.,
ASSAYERS AND WASTE PRODUCT SMELTERS,
1661 Larimer St., Denver, Colo.
Donaldson's Assayers' Slag Hammer 1lb.....\$1.10
1lb. 3oz.....\$1.25

Seeing is Believing.

If you could see the efficiency, the money saving, the practicality of the

Cross Oil Filter

you would believe our strong claims. That's why we send our filters on 30 days' trial, to be returned at our expense if not satisfactory. Shall we convince you now?

THE BURT MFG. CO.,
Akron, Ohio, U. S. A.
Largest Mfrs. of Oil Filters in the World.

We also manufacture the BURT EXHAUST HEAD.

BRITISH COLUMBIA MINES

Gold, Silver-Lead and Copper Properties. Excellent chance for profitable investments in legitimate mining in BRITISH COLUMBIA. Capital needed for developing promising prospects. A specialty made of FREE MILLING GOLD properties. Very promising FREE MILLING GOLD properties for sale; terms reasonable. Mines examined and reported on by reliable mining engineers. Correspondence solicited. Address Andrew F. Rosenberger, P. O. Box 700 Nelson, B. C.

Quicksilver
BY THE FLASK OR CARLOAD.
The Eureka Company,
OF SAN FRANCISCO.
320 SANSOME STREET, - SAN FRANCISCO.

HEADQUARTERS FOR
QUICKSILVER.

LOWEST RATES. Correspondence Solicited.
LANGLEY & MICHAELS CO.,
34-40 FIRST STREET, SAN FRANCISCO.

WANTED—GOOD SECOND-HAND SET CRUSHING ROLLS.
State price and particulars to THE MOUNTAIN COPPER CO., LTD., Keswick, Shasta Co., Cal.

WILLIS SHAW,

627 New York Life Bldg., CHICAGO.

Notice of Removal.

On or About MARCH 15th

NEXT, THE

JUSTINIAN CAIRE COMPANY

WILL REMOVE THEIR STOCK OF

Assayers' Materials, Chemicals and Mill Screens

To Their NEW BUILDING at

565-567 MARKET STREET, SAN FRANCISCO, CAL.

This cut illustrates our 4 H. P. to 8 H. P. HOISTING PLANT.

Larger sizes built to suit the demands of our customers.

It is strong and exceedingly simple and durable, being entirely under the control of the operator, by the use of a single hand lever for hoisting, while the lowering is governed by a foot lever and brake. No better device has been designed for this purpose. For prices and further information address the builders.

Pat. applied for.

THE SIMPLEX ORE CRUSHER.

For crushing and pulverizing small quantities of ore by either hand or power. It is more easily operated than any other machine of its capacity on the market.

Its features are ease of opening for cleaning and simplicity of adjustment.

CALKINS' GYRATORY MULLER.

A recent invention for reducing crushed ore samples to a pulp. Will quickly pulverize to 100 mesh or finer.

Supersedes the slow and laborious Bucking Plate.

CALKINS' RADIAL BUCKING PLATE.

Designed to replace the old method of pulverizing crushed ore samples to a pulp of any desired fineness with but a fraction of the energy required to operate the old style Bucking Board and Muller.

THE COLORADO IRON WORKS CO.,

Established 1860.

DENVER, COLO., U. S. A.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

The Best Buildings.

The best buildings in America to-day are roofed with P. & B. Ready Roofing, because it is the best for the buildings. It is better than shingles, because it doesn't warp in the sun; better than iron, because it won't expand or contract with heat or cold; better than slate, because it doesn't flake off and blow away; better than tin, because it doesn't sweat and rust out. Better than other roofing, because it's made better, and is. Put up in compact rolls, easy and cheap to transport.

DENVER, COLO.

One to two horse power operates this drill. Costs less than any power drill to install. Saves over 50% in cost of power. Cuts as much rock as any air drill. Send for circular and testimonials to

The Gardner Electric Drill and Machinery Co.,

1725 to 1731 Blake St.,

DENVER, COLORADO.

A Dry Pulverizer

FOR ORES, CEMENT and
HARD SUBSTANCES.

Equals a 50-ton stamp mill. Grinds to any mesh under 8.

No slimes, no choking. Takes any fineness of feed under 1 in.

No special foundation. No quartered belts. No internal screens. Outside separation gives 100 per cent product most uniform and granular.

No oil in product. No stoppages for oiling or adjusting.

Can be used wet. Can be moved on a truck. Guaranteed for one year. Free new for worn out parts.

Little wear, no duplicate parts, no break-downs. Cost 1/4 to 1-10 of any installation of same capacity. Takes only one-half the horse power. Is automatic.
